## Foreword

The 2014 Myanmar Population and Housing Census (2014 Census) was conducted with midnight of 29 March 2014 as the reference point. This is the first Census in 30 years; the last was conducted in 1983. Planning and execution of this Census was spearheaded by the former Ministry of Immigration and Population, now the Ministry of Labour, Immigration and Population, on behalf of the Government, in accordance with the Population and Housing Census Law, 2013. The main objective of the 2014 Census is to provide the Government and other stakeholders with essential information on the population, in regard to demographic, social and economic characteristics and housing conditions and household amenities. By generating such information at all administrative levels, it is also intended to provide a sound basis for evidence-based decision-making, and to evaluate the impact of social and economic policies and programmes in the country.

The results of the 2014 Census have been published so far in a number of volumes. The first was the Provisional Results (Census Volume 1), released in August 2014. The Census Main Results were launched in May 2015. These included The Union Report (Census Report Volume 2), Highlights of the Main Results (Census Report Volume 2-A), and the reports for each of the 15 States and Regions (Census Report Volume 3[A-O]). The reports on Occupation and Industry (Census Report Volume 2-B), and Religion (Census Report Volume 2-C) were launched in March 2016 and July 2016, respectively.

The current set of the 2014 Census publications comprises 13 thematic reports and a Census Atlas. They address issues on Fertility and Nuptiality; Mortality; Maternal Mortality; Migration and Urbanization; Population Projections; Population Dynamics; the Older Population; Children and Youth; Education; Labour Force; Disability; Gender Dimensions; and Housing Conditions and Household Amenities. Their preparation involved collaborative efforts with both local and international experts as well as various Government Ministries, Departments and research institutions. The thematic reports published to date include: Fertility and Nuptiality; Mortality; Maternal Mortality; Migration and Urbanization; Population Dynamics; Population Projections; the Labour Force; and Education.

Data capture of the Census was undertaken using scanning technology. The processes were highly integrated, with tight controls to guarantee accuracy of results. To achieve internal consistency and minimize errors, rigorous data editing and validation were carried out to facilitate further analysis of the results. The information presented in these reports is therefore based on more cleaned data sets, and the reader should be aware that there may be some small differences from the results published in the first set of volumes. In such instances, the data in the thematic reports should be preferred.

This report describes the main findings from the information collected in the Census on housing conditions in Myanmar and the access that households have to a range of amenities, and assests.

The report shows that most households own their dwellings and have access to improved drinking water sources as well as improved sanitation. However, the report also shows areas of concern. There are huge differentials between urban and rural areas as well as across States/Regions and Districts on some key indicators, which include building materials of
housing units and access to information and communication devices. Most of the owned housing units are constructed of materials which arguably require replacement within a relatively short period of time of typically less than ten years. This means that there is a need for a mechanism for maintenance to ensure that the existing housing stock identified in the Census does not deteriorate. Though generally high, access to improved water sources and sanitation rates fall short of national targets. In addition, the high use of traditional and unsustainable sources of energy for cooking exposes household members to the health risks of poor indoor air quality, especially in enclosed environments.

On behalf of the Government of Myanmar, I wish to thank the teams at the Department of Population, the United Nations Population Fund (UNFPA) and the authors for their contribution towards the preparation of this thematic report. I would also like to thank our development partners, namely; Australia, Finland, Germany, Italy, Norway, Sweden, Switzerland, and the United Kingdom for their support to undertake the Census, as well as the technical support provided by the United States of America.

## Executive Summary / XI

## 1. Introduction

1.1 Census background: history and overview of 2014 Census / 1
1.2 Overview and meaning of 'Housing' / 1 1.2.1 Housing, context and meaning / 2 1.2.2 Housing policies and programmes in Myanmar / 3 1.2.3 Housing and human settlements: international dimensions / 4
1.3 Overview of the Report / 5

## 2. Methodology and data assessment / 7

2.1 Housing data in the 2014 Census: an assessment of data quality / 7
2.1.1 Coverage of the recommended topics / 7
2.1.2 Data quality assessment / 9
2.2 Analytical approach / 11
2.3 Limitations / 11

## 3. Household characteristics / 13

3.1 Household size / 13
3.2 Household structure / 15
3.2.1 Household classification and type / 15
3.2.2 Household heads by age and sex / 17
3.3 Household formation and headship / 21
3.3.1 Household formation / 21
3.3.2 Headship rates / 21

## 4. Tenure conditions and dwelling types / 25

4.1 Introduction / 25
4.2 Tenure status / 25
4.2.1 Levels of home ownership / 25
4.2.2 Tenure status by sex of household head / 26
4.2.3 Tenure status by age of head of household / 27
4.2.4 Tenure and economic activity of household head / 31
4.2.5 Tenure and construction materials / 32
4.3 Type of Housing Units / 34
5. Building materials / 36
5.1 Concept of durability / 36
5.2 External wall materials / 37
5.3 Roofing materials/ 38
5.4 Floor materials / 39
6. Household amenities and assets / 41
6.1 Water supply and sanitation / 41
6.1.1 Access to improved drinking water / 43
6.1.2 Access to improved sanitation / 45
6.2 Household energy sources / 47
6.2.1 Cooking fuel / 49
6.2.2 Energy for lighting / 51
6.3 Household assets / 53
6.3.1 Access to information and communications devices / 54
6.3.2 Access to mobility assets / 56

## 7. Housing adequacy and quality / 5

7.1 Constructing a consolidated housing quality index / 59
7.2 Housing quality dynamics / 61
7.2.1 Housing quality and household size / 62
7.2.2 Housing quality and tenure / 63
7.2.3 Housing quality and economic activity of head of household / 65
7.2.4 Housing quality and type of dwelling / 65
7.3 Homelessness/persons in other collective quarters / 67
7.4 Housing requirements / 68
8. Conclusion and recommendations / 70
8.1 Conclusion / 70
8.2 Recommendations / 71

4.3 Percentage of households by tenure by age of head, urban and rural areas, 2014 Census / 28
4.4 Percentage of households owning the housing units they occupy by age of head, urban and rural areas, 2014 Census / 30
4.5 Percentage of households by tenure by economic activity of head, 2014 Census / 31
4.6 Percentage of economically active heads of household by activity status by tenure, 2014 Census / 32
4.7 Percentage of households by main construction material of walls of housing units, 2014 Census / 33
4.8 Percentage of households by tenure by construction materials of walls of housing units, 2014 Census / 34
4.9 Percentage of households by type of housing unit, urban and rural areas and sex of household head, 2014 Census / 35
5.1 Percentage of households by durability of wall materials, urban and rural areas, State/ Region, 2014 Census / 37
5.2 Percentage of households by durability of roofing materials, urban and rural areas, State/Region, 2014 Census / 39
5.3 Percentage of households by type of floor materials, urban and rural areas, State/ Region, 2014 Census / 40
6.1 Percentage of households with or without access to improved drinking water, urban and rural areas, 2014 Census / 43
6.2 Percentage of households with access to improved drinking water, State/Region, 2014 Census / 44
6.3 Percentage of households with or without access to improved sanitation, urban and rural areas, 2014 Census / 45
6.4 Percentage of households with access to improved sanitation, State/Region, 2014 Census / 46
6.5 Percentage of households by main type of cooking fuel, 2014 Census / 49

## List of Figures

6.6 Percentage of households with access to modern and sustainable energy sources for cooking, State/Region, 2014 Census / 50
6.7 Percentage of households by type of energy source for lighting, urban and rural areas, 2014 Census / 51
6.8 Percentage of households using modern and sustainable energy sources for lighting, State/Region, 2014 Census / 52
6.9 Percentage of households with access to selected ICT devices, urban and rural areas, 2014 Census / 54
6.10 Percentage of households with access to mobility assets, urban and rural areas, 2014 Census / 56
6.11 Percentage of households with access to a car, selected countries in the South-East Asia region / 57
7.1 Percentage of households by housing quality rank, urban and rural areas, State/Region, 2014 Census / 62
7.2 Percentage of households by housing quality rank by household size, 2014 Census / 63
7.3 Percentage of households by housing quality rank by tenure, urban and rural areas, 2014 Census / 64
7.4 Percentage of households by tenure by housing quality rank, 2014 Census / 64
7.5 Percentage of households by economic activity of head by housing quality rank, 2014 Census / 65
7.6 Percentage of households by housing quality rank by type of dwelling, urban and rural areas, 2014 Census / 66
7.7 Percentage of households by type of dwelling by housing quality rank, 2014 Census / 66

## List of Tables in Appendices

A1 (a) Households by household size, urban and rural areas, and State/Region, 2014 Census / 80
(b) Households by household size, State/Region and District, 2014 Census / 82

A2 Households by household composition type, State/Region, 2014 Census
(a) Couple households / 86
(b) Non-couple households / 88

A3 Number of households by age by sex of head of household, urban and rural areas, State/Region and District, 2014 Census / 90
A4 Households by tenure, urban and rural areas, State/Region, 2014 Census / 102
A5 Households by age by sex of head, by tenure, urban and rural areas, 2014 Census / 105
A6 (a) Households by tenure by economic activity of household head, 2014 Census / 106
(b) Households by tenure by construction material of wall, 2014 Census / 106

A7 (a) Number and percentage of households by durability of construction materials for wall, urban and rural areas, State/Region and District, 2014 Census / 107
(b) Number and percentage of households by durability of construction materials for roofing, urban and rural areas, State/Region, and District, 2014 Census / 110
(c) Number and percentage of households by type of construction materials for floor, urban and rural areas, State/Region, and District, 2014 Census / 113
A8 Number and percentage of households by access to improved sources of drinking water and sanitation, urban and rural areas, State/Region and District, 2014 Census / 116
A9 Percentage of households by classification of energy sources for cooking and lighting, urban and rural areas, State/Region and District, 2014 Census / 119
A10 Number and percentage of households with access to ICT devices, urban and rural areas, State/Region, 2014 Census / 122
A11 Number and percentage of households with access to mobility assets, urban and rural areas, State/Region, 2014 Census / 125
A12 Number and percentage of households by housing quality rank, urban and rural areas, State/Region and District, 2014 Census / 128
A13 (a) Number and percentage of households by housing quality rank by household size, urban and rural areas, 2014 Census / 131
(b) Number and percentage of households by housing quality rank by tenure, urban and rural areas, 2014 Census / 132
(c) Number and percentage of households by housing quality rank by economic activity status of head, urban and rural areas, 2014 Census / 133
(d) Number and percentage of households by housing quality index rank by type of dwelling, urban and rural areas, 2014 Census / 134

## Executive Summary

This thematic report on Housing Conditions and Household Amenities presents the living conditions of households in Myanmar using data from the 2014 Myanmar Population and Housing Census. The report specifically looks at the following key indicators of living conditions and housing characteristics: household conditions; type and ownership (tenure status) of housing unit; main source of lighting, cooking fuel and water for drinking; type of toilet (sanitation); main construction material used for the roof, wall and floor of housing units; and use of or access to household assets.

There were 10,877,832 conventional households in Myanmar in 2014; a 67 per cent increase from the $6,495,621$ households enumerated in 1983. With a total population of 47,929,999 in conventional households, the average household size was 4.4 , which was a noticeable decline from the average of about five during the period 1983 to 2001. Myanmar's average household size is slightly higher than that of most neighbouring countries, except the Philippines.

Most households comprise couples living with children (41.4 per cent) and couples living with children and relatives ( 17.2 per cent). The structure of households has largely remained the same since 1983 even though there has been a slight decrease in larger households of nine persons or more.

About one in four households (23.7 per cent) were female-headed, with this proportion being higher in urban areas ( 27.7 per cent) than rural areas ( 22.2 per cent). The age-specific headship rate increases with age and peaks at around 0.6 between the ages of 60 and 69 .
Some 85.5 per cent of households in Myanmar own the housing units they live in, with this proportion being slightly higher among female-headed households ( 87.3 per cent) than male headed households ( 85.0 per cent), and higher in rural areas ( 93.1 per cent) than in urban areas ( 66.0 per cent). The gender differentials are observed in both urban and rural areas, as well as across States/Regions and Districts. Housing ownership increases with age, rising from 68.7 per cent among heads of households aged 15-24 to 94.9 per cent among those aged 65 and over, and this is the case among both male and female-headed households.

Most households in the country (81.4 per cent) use traditional and unsustainable energy sources, particularly firewood, for cooking while only 16.8 per cent use modern and sustainable energy sources. Even in urban areas, a substantial proportion of households ( 52.8 per cent) use traditional and unsustainable sources of energy for cooking compared with only 45.4 per cent that use modern and sustainable sources. More than 9 out of 10 households ( 92.5 per cent) use traditional and unsustainable sources of energy for cooking in rural areas.

Slightly more than two out of five households (41.1 per cent) in the country use modern and sustainable sources of energy for lighting, with the proportion being much higher in urban areas ( 78.9 per cent) than in rural areas ( 26.4 per cent).

A housing quality index, described in Chapter 7, shows that households living in housing ranked level 3 (out of five bands) comprised the largest proportion ( 42.3 per cent). At the Union level, only 10.9 per cent of households lived in the highest rank. However, urban and rural differences were large: 32.3 per cent of urban households lived in the highest housing quality ranked level 1, while the corresponding figure for rural households was 2.5 per
cent. Among the various tenure categories, the highest housing quality was found among Government quarters ( 59.9 per cent). Among economically active persons, government employees have the highest quality of housing (47.1 per cent). 'Condominiums/apartments/ flats' is the type of dwelling that provides the highest quality housing, with 79.7 per cent of households ranked 1 occupying such accommodation.

More than two-thirds of households (69.5 per cent) have access to improved drinking water sources in the country, with the proportion being higher in urban areas ( 86.7 per cent) than in rural areas (62.7 per cent).

About three quarters ( 74.3 per cent) of households had access to improved sanitation, with the proportion again being higher in urban areas ( 92.3 per cent) than in rural areas (67.3 per cent). Myanmar's access to improved sanitation is slightly above the South-East Asian regional average of 72 per cent. Among the States/Regions, Yangon reported the highest access rate ( 91.1 per cent) and Rakhine the lowest (31.8 per cent). Among the Districts, the highest access rates were recorded in East and West Yangon ( 96.4 per cent and 96.2 per cent respectively) while Myauk U (in Rakhine State) recorded the lowest (18.7 per cent).

Almost half of all households in Myanmar have access to a television (49.5 per cent), followed by a radio ( 35.5 per cent) and a mobile phone ( 32.9 per cent). The least accessible information and communications technology (ICT) assets were the internet ( 6.2 per cent) and a computer ( 3.5 per cent). About a third of households ( 30.3 per cent) did not have any of the recorded electronic communications equipment, with the proportion being twice as high in rural areas ( 36.4 per cent) than in urban areas ( 14.8 per cent). Access to or use of transportation facilities was highest for motorcycle/moped/tuk tuk ( 38.7 per cent) and bicycles ( 35.9 per cent). The least accessible type of transportation was a car/pick-up/truck/ van ( 3.1 per cent), which is one of the lowest rates in South-East Asian countries where, for example, in countries such as South Korea, Malaysia and Japan, four out of five households own a car.

Based on an estimate of the number of homeless people and those living in other collective quarters, and the number of households living in deficient and extremely deficient living conditions, a core housing need of 3.8 million units was estimated for the country.

In conclusion, the report shows that most households own their dwellings and have access to improved drinking water sources as well as improved sanitation. The report also shows gender parity on most housing indicators. However, the report also shows areas of concern. Firstly, there are huge differentials between urban and rural areas as well as across States/ Regions and Districts on some key indicators, which include building materials of housing units and access to information and communications devices.

Secondly, most of the owned housing units are constructed of wall materials which arguably require replacement within a relatively short period of time of typically less than ten years. This means that there is a need for a mechanism for maintenance to ensure that the existing housing stock identified in the Census does not deteriorate.

Thirdly, though generally high, access to improved water sources and sanitation rates fall short of national targets. Fourthly, the high use of traditional and unsustainable sources of energy for cooking exposes household members to the health risks of poor indoor air quality, especially in enclosed environments. It also means that Sustainable Development Goal (SDG) 7 which seeks to "ensure access to affordable, reliable, sustainable and modern energy for all" is far from being met. However, the higher use of modern sustainable sources of energy for lighting compared with cooking implies that non-use of such energy sources for cooking could be due to factors other than access. Finally, the low access to internet and computers in households in rural areas could reflect the challenges of connectivity to an electricity supply and higher levels of poverty which need to be addressed.

## Chapter 1. Introduction

### 1.1 Census background: history and overview of 2014 Census

Population and housing censuses are the principal means of collecting basic population and housing statistics as part of an integrated programme of data collection and compilation. Censuses provide a comprehensive source of statistics required for tracking demographic trends; social and economic development; assessing conditions in human settlements; and for use in policymaking, planning and research. The collected data also facilitate intra- and international comparisons over time and enable the monitoring and evaluation of progress made in policy interventions.

The history of census taking in Myanmar dates back to 500 BC during the era of King Thadodipa Mahadamayaza of the Tagaung Dynasty. The first population census under the British administration was carried out in the lower part of Myanmar in 1872; this was part of the Indian census. Thereafter, censuses were taken every ten years starting from 1881. The 1891 census and subsequent censuses were conducted throughout the whole country on a decennial basis up to 1941. In post-independent Myanmar, nationwide censuses were held in 1973 and 1983. There were challenges in all of these post-independence censuses, especially due to lack of access to some parts of the country. Since 1983, more than 30 years have passed without reliable and timely census information for Myanmar.

The 2014 Myanmar Population and Housing Census (referred to hereafter as the 2014 Census) was conducted from 29th March to 10th April 2014 under the legal framework of the Population and Housing Census Law No. 19 of 2013. The Law empowers the Ministry of Immigration and Population (now renamed The Ministry of Labour, Immigration and Population) to collect, process, analyse, publish and disseminate information obtained through the census. The 2014 Census enumeration aimed to count all persons who were within the borders of Myanmar on the night of 29th March 2014 (Census Night).

The specific objectives of the 2014 Myanmar Census were to ascertain the following:
(a) Size, composition and spatial distribution of the population
(b) Levels of education attained by the population
(c) Size and deployment of the labour force
(d) Levels of fertility, mortality and migration
(e) Size and prevalence of persons with a disability
(f) Rate and pattern of urbanization
(g) Housing conditions and availability of household amenities and assets.

### 1.2 Overview and meaning of 'Housing’

Housing and human settlements development policies are key instruments for facilitating access to adequate housing and sustainable development. Policies should be responsive to national and subnational needs and circumstances. In order to shape policies to address national needs and to develop a comprehensive framework for both monitoring the housing sector and the continuous review of national housing policies, up-to-date data is critical. Housing censuses are the main sources for benchmarking housing data particularly in less

## Chapter 1. Introduction

developed countries where systems for the generation of data from administrative systems are either weak or non-existent.

### 1.2.1 Housing, context and meaning

A house is a shelter for any living activities of humans. These activities could include cooking, eating, sleeping and tending children, among others. A house is often established as a physical element within a discrete physical space but interfacing with the natural and other parts of the physical environment. However, there are different nuances to the wider concept of 'housing', for which there is no one readily acceptable definition but which might generally be considered as a multi-dimensional product that includes physical shelter; socioeconomic and cultural dynamics; related services and infrastructure; and the inputs required to produce and maintain it. It also includes the processes and outcomes of the production and use of residential dwellings.

Viewed sometimes mistakenly and variedly as a physical and environmental good, a socioeconomic good and a political object, housing is often misunderstood. However, housing combines all these attributes at all times when viewed in its comprehensive sense. Housing as a physical and environmental good, shelters humans from hostilities emanating from the environment. It is a modified (man-made) condition of the human habitat that is intended to protect humans from the vagaries of weather, from predators and other dangers. As a physical good, it can be broken down into a fixed structure plus services that include water, sewerage, electricity and other utilities.

Housing is also an economic good as well as a political object in the sense that it can be bought and sold in the market in its entirety or in its constituent parts. As an economic good, housing is nevertheless expensive. It may require the bulk of a household's whole lifetime income or savings, and, in many cases, families may never be able to afford decent housing (that is housing the generally conforms to modern standards of fitness, structure, energy and facilities). In this context housing becomes an important indicator of the economic wellbeing of households, social groups, regions and nations. In analyzing the development of a housing policy, it is important to note that it cannot be divorced from economic, political and social processes (Agus et al, 2002, p3).

The functions of housing as a physical and environmental good, and the economic burden of its procurement, consequently brings with it serious implications for public health and public interest. Low income levels may force households to acquire housing which is inadequate either in terms of its physical attributes or because of its location. Such inadequate housing may result in a number of negative consequences such as outbreak of diseases and intense dissatisfaction of household members that, in extreme circumstances, may result in a sense of hopelessness. These consequences therefore make housing a political object particularly when people feel insecure and attribute their predicament to failed or misdirected policies from local and central government concerning the building and availability of housing. Such policies could include building regulations as well as housing policies and programmes.

To improve the housing situation - particularly of the urban poor - it is necessary to think in terms of a two-level approach. The first, at the macro level, involves dealing with such factors

## Chapter 1. Introduction

as land and tax reform, income redistribution, and full employment as part of a coherent urbanization strategy. The second, at the micro level, encompasses addressing both housing and local spatial-oriented policies, of which the on-site upgrading of sites and services are major components. The fact that public housing has failed to solve the housing problem of the urban poor in many countries does not mean that it has no place in any country's housing policy (Yeh, 1982). Appropriate policy approaches to public housing should therefore be adopted, and continuously reviewed and evaluated, based on empirical data and information from housing censuses and surveys, for countries to adopt the most workable urban housing solutions.

### 1.2.2 Housing policies and programmes in Myanmar

Housing censuses are used to develop benchmark housing statistics and to formulate housing policy and programmes, and, in the private sector, to assist in site selection for industrial, retail and service facilities, as well as for the commercial development of residential housing (United Nations, 2008, p 237). However, from the literature reviewed, a codified housing policy in Myanmar has largely been lacking until November 2014 when the then President of Myanmar, His Excellency U Thein Sein, launched the National Workshop on Urban and Housing Policy and Planning. A United Nations report in 1991 referring to the Resource Conservation and Rangeland Development Program (RCRDP) stated that: ".... the situation in 1984 could be described as one in which a housing policy did not exist" (UN-Habitat, 1991, p 30).

The chronology of housing policies in Myanmar (illustrated in Figure 1.1) was set out by the Japan-OECD Policy Forum on Urban Development and Green Growth in conjunction with the Department of Human Settlements and Housing Development of the Ministry of Construction of Myanmar, in a joint evaluation of human settlements and urban developmentrelated policies and programmes in October 2014.

## Chapter 1. Introduction

### 1.2.3 Housing and human settlements: international dimensions

The publication of this report takes place at a very critical moment in the history of global human settlements development. The world is moving forward from the Millennium Development Goals (MDGs) to the 2030 Agenda for Sustainable Development (UN, 2015) and is interfacing the Habitat Agenda (UN-Habitat, 1996) with a new Urban Agenda discussed in October 2016 in Quito, Ecuador. There was therefore the need to generate data and indicators from the Census which will enable Myanmar to track progress nationally and subnationally to attain the Sustainable Development Goals (SDGs) and for international comparison when reporting at international platforms.

The 2030 Agenda for Sustainable Development sets out 17 Sustainable Development Goals (SDGs) of which the following are directly related to human settlements development:

- SDG 6: Ensure availability and sustainable management of water and sanitation for all
- SDG 7: Ensure access to affordable, reliable, sustainable and modern energy for all
- SDG 11: Make cities and human settlements inclusive, safe, resilient and sustainable
- Target 11.1: By 2030, ensure access for all to adequate, safe and affordable housing and basic services and upgrade slums.

It is important to recognize that under the 2030 Agenda for Sustainable Development, the upgrading of slums still remains relevant. Slums, in general, are settlements which depict the following characteristics:

- Inhabitants have no security of tenure vis-à-vis the land or dwellings they inhabit, with modalities ranging from squatting to informal rental housing.
- Neighbourhoods usually exhibit very high densities compared to other areas of the city, lack, or are cut off from, basic services and city infrastructure.
- Housing may not comply with current planning and building regulations, and is often situated in geographically and environmentally hazardous areas.

According to UN-Habitat, informal settlements, slums and other poor residential neighbourhoods are a global urban phenomenon. They exist in urban contexts all over the world, in various forms and typologies, dimensions, locations and by a range of names (squatter settlements, favelas, poblaciones, shacks, shanties, barrios bajos, bidonvilles) (see Figure 1.2).

[^0]
## Chapter 1. Introduction

Since 2003, United Nations Member States have agreed to define a slum household as a group of individuals living under the same roof lacking one or more of the following five conditions:
(1) Access to improved water
(2) Access to improved sanitation facilities
(3) Sufficient living area - not overcrowded
(4) Structural quality/durability of dwellings
(5) Security of tenure.

### 1.3 Overview of the Report

This report covers three broad areas, that is: household characteristics (but only to the extent that these characteristics interact with housing dynamics); housing characteristics and quality; and housing amenities and household assets. The report also enumerates key factors of housing in its comprehensive definition, the policy paradigms and international policy platforms addressing housing and human settlement issues. Elements of housing are also teased out as far as the Census data would allow.

It is emphasized for clarity that the analyses of households, housing conditions and household amenities in this thematic report largely relate only to persons living in enumerated conventional households. This will assist in interpreting results where changes in household size between censuses are being analysed. However, the report also looks at the issue of homelessness, even though data for this was generated using the Institution questionnaire and was combined with persons living in other collective quarters. This was undertaken to establish the extent of those that live in conditions of extreme housing deprivation.

Finally, a brief recommendation is proposed for any future census based on a comparison of the structure of the housing section of the 2014 Census questionnaire and the United Nations Principles and Recommendations for Population and Housing Censuses (2 $2^{\text {nd }}$ revision) (2007).

The main objectives in preparing this report were to:

- Review literature in the context of emerging issues and methodological fields
- Assess data quality and limitations
- Compile levels and, where possible, trends within the country, at the State/Region level and where applicable at the District level
- Interpret the findings in the context of polices which have impacted on housing, and where appropriate, make recommendations.

This thematic report seeks to present the living conditions of households in Myanmar using data from the 2014 Census. More specifically, the report seeks to present the status and, where possible, trends of the following key indicators of living conditions and housing characteristics:

- Household characteristics
- Tenure status of household
- Type of housing unit
- Main source of lighting

## Chapter 1. Introduction

- Main cooking fuel
- Main source of water for drinking
- Type of toilet facilities (sanitation)
- Main construction material used for the roof, wall and floor of housing units
- Access to household assets.

Figure 1.2 shows the questions used to collect the housing data in the 2014 Census.
Figure 1.2

# Chapter 2. Methodology and data assessment 

### 2.1 Housing data in the 2014 Census: an assessment of data quality

### 2.1.1 Coverage of the recommended topics

A housing census is the total process of collecting, compiling, evaluating, analyzing and publishing or otherwise disseminating statistical data pertaining, at a specified time, to all living quarters and occupants thereof in a country or in a well delineated part of a country. The census should provide information on the quantity/supply of housing units together with information on the structural characteristics and facilities that have a bearing upon the maintenance of privacy and health and the development of normal family living conditions (United Nations, 2008, p7).

The housing census produces benchmark statistics on the current housing situation and is vital for developing national housing and human settlements programmes. The housing census is also valuable for providing the sampling frame for special housing and related surveys during the intercensal years.

Due to limited resources to conduct separate housing and population censuses especially in less developed countries, the United Nations Principles and Recommendations for Population and Housing Censuses notes that "...it is customary to conduct housing and population censuses simultaneously" (United Nations, 2008, p185).

The topics to be covered in the census questionnaire should be determined upon a balanced consideration of the:
(a) Needs of the country (national as well as local)
(b) Achievement of international comparability
(c) Probable willingness and ability of the public to give adequate information on the topics
(d) Total national resources available for conducting the census.

Table 2.1 summarizes the extent of coverage of the internationally recommended housing topics in the 2014 Census. Coverage of the topics was only partially compliant with the United Nations recommendations, and, in future should (as recommended in Chapter 8) be improved, especially to cover other 'core' topics such as the number of rooms available to the household and a count of dwelling units available.

## Chapter 2. Methodology and data assessment

## Table 2.1

Coverage of housing topics in the $\mathbf{2 0 1 4}$ Myanmar Census

|  | Housing Topic | UN Classification | Covered by 2014 Myanmar Census |
| :---: | :---: | :---: | :---: |
| 1. | Living quarters - type of | CD | N |
| 2. | Location | CD | Y |
| 3. | Occupancy status | C | N |
| 4. | Ownership - type of | C | Y |
| 5. | Rooms - number of | C | N |
| 6. | Bedrooms - number of | NC | N |
| 7. | Useful floor space | NC | N |
| 8. | Water supply system | C | N |
| 9. | Drinking water - main source | c | Y |
| 10. | Toilet - type of | c | Y |
| 11. | Sewage disposal | c | N |
| 12. | Bathing facilities | c | N |
| 13. | Kitchen - availability of | c | N |
| 14. | Fuel used for cooking | c | Y |
| 15. | Lighting and/or electricity - type of | C | Y |
| 16. | Solid waste disposal - main type of | C | N |
| 17. | Heating - type and energy used for | NC | N |
| 18. | Hot water - availability of | NC | N |
| 19. | Piped gas - availability of | NC | N |
| 20. | Use of housing unit | NC | N |
| 21. | Occupancy by one or more households | CD | N |
| 22. | Occupants - number of | C | Y |
| 23. | Building - type of | CD | N |
| 24. | Type of housing unit (dwelling) | A | Y |
| 25. | Construction material of outer walls | C | Y |
| 26. | Year or period of construction | C | N |
| 27. | Dwellings in the building - number of | NC | N |
| 28. | Construction material of floors, roof | NC | Y |
| 29. | Elevator - availability of | NC | N |
| 30. | Farm building | NC | N |
| 31. | State of repair | NC | N |
| 32. | Age and sex of head or other reference member of household | C | Y |
| 33. | Tenure | C | Y |
| 34. | Rental and owner-occupied housing costs | NC | N |
| 35. | Furnished/unfurnished | NC | N |
| 36. | Information and communications technology (ICT) devices - availability of | C | Y |
| 37. | Cars - number of | NC | Y |
| 38. | Durable household appliances - availability of | NC | Y |
| 39. | Mobility assets - availability of | A | Y |
| 40. | Available outdoor space | NC | N |

## Chapter 2. Methodology and data assessment

## Key for Table 2.1

C - Core topic recommended by the United Nations.
CD - Core topic (derived from other information collected) recommended by the United Nations.
NC - Non-core topic recommended by the United Nations.
A - Additional topic not specifically recommended by the United Nations but included in the Myanmar Census.
Y - Yes, the topic was covered in the Myanmar Census.
$\mathbf{N}$ - No, the topic was not covered in the Myanmar Census.

As noted in Table 2.1, coverage of the United Nations recommended topics in the 2014 Census may be judged to have only been partially satisfactory since only 11 out of the 22 recommended core topics were covered. There is therefore a need for improvement in coverage in future censuses.

### 2.1.2 Data quality assessment

Data quality assessment (DQA) is the scientific and statistical evaluation of data to determine if those obtained from a source such as a census or survey are of the right type, quality, and quantity to support their intended use. DQA is built on a fundamental premise: data quality, as a concept, is meaningful only when it relates to the intended use of the data. Data quality does not exist in a vacuum; it must be known in what context a data set is to be used in order to establish a relevant yardstick for judging whether or not the data set is adequate.

Based on the above premise therefore, this evaluation of the quality of housing data in the 2014 Census has been carried out by considering the following quality components.

## Relevance

The data captured in the 2014 Myanmar Census as evaluated against the United Nations recommendations (United Nations, 2008) would be gauged to have covered less than 50 per cent of the required topics. It is, however, important to note that most of the topics recommended by the United Nations are more relevant to developed countries and in most cases are not applicable to the Myanmar context. Significantly though, key topics such as number and size of rooms occupied were not covered thus rendering measurement of some key indicators such as overcrowding in households and the prevalence of slums difficult.

Furthermore, the classification of some elements and options should be separated in future to avoid the inclusion of inapplicable response categories (such as in the question on main construction materials - see Figure 1.2). More fundamentally, however, an assessment of 'relevance' should reflect more the degree in which the data meets the needs of national and local users (irrespective of whether or not the topics covered conform to international recommendations). In this respect, the content of the 2014 Census reflected the outcome of user consultations held during the design of the questionnaire, after the pilot census in 2013, and during preparations for this report, bearing in mind that a census had not been carried out for more than 30 years in Myanmar and that the volume of information and its quality had to be balanced. To a large extent user needs were satisfied, and, therefore, the 2014 Census data was relevant.

## Chapter 2. Methodology and data assessment

## Accuracy

The accuracy of the data (defined as the degree to which the information correctly describes the phenomena it was designed to measure) was evaluated using cross-tabulations and comparison with other national sample surveys and previous censuses ${ }^{2}$. From this evaluation, the housing data is deemed to be fairly close to the exact or actual values. However, as is appreciated, statistics are never identical with the true values because of variability (the statistics change from implementation to implementation of surveys due to random effects) and bias (the average of the estimates from each implementation is not equal to the true value due to systematic effects). Moreover, the accuracy of the Census data will have been affected to some degree by the level of under-enumeration in some parts of the country, particularly in Rakhine State. This issue is discussed in more detail in the Main Results (Department of Population, 2015) and is also noted below.

## Timeliness and punctuality

Timeliness with respect to the housing data was evaluated by comparing the date of the initial publication of data as part of the Main Results (Department of Population, 2015) with the date of the enumeration. The initial results were released within 14 months of the Census date, which was in accordance with the data release calendar and in line with the United Nations Principles and Recommendations on Population and Housing Censuses (United Nations, 2008).

## Comparability

For the housing component of the 2014 Census data, comparability over time and with other recent surveys between geographical areas within the country and with other countries within the region, and between domains is judged in this report to be satisfactory.

## Coherence

The housing data, especially those regarding household structure and composition, and access to drinking water and lighting fuel are reasonable and consistent in comparison with the same data from other independent sources such as the Fertility and Reproductive Health Survey and the Labour Force Survey.

## Accessibility and clarity

The way the housing data was obtained and packaged is easy for users to access and apply for various purposes. The data and metadata are available in various formats in reports, excel files, a CD-ROM and online on the Department of Population's website.

[^1]
## Chapter 2. Methodology and data assessment

### 2.2 Analytical approach

The Global Plan of Action of the Habitat Agenda clearly illustrates the key components of adequate shelter and thus states that:

#### Abstract

Adequate shelter means more than a roof over one's head. It also means adequate privacy; adequate space; physical accessibility; adequate security; security of tenure; structural stability and durability; adequate lighting, heating and ventilation; adequate basic infrastructure, such as water-supply, sanitation and waste-management facilities; suitable environmental quality and health-related factors; and adequate and accessible location with regard to work and basic facilities: all of which should be available at an affordable cost. Adequacy should be determined together with the people concerned, bearing in mind the prospect for gradual development. Adequacy often varies from country to country, since it depends on specific cultural, social, environmental and economic factors. Gender-specific and age-specific factors, such as the exposure of children and women to toxic substances, should be considered in this context. (UNHabitat, 1996).

Whereas the overall approach in this analysis has been anchored on the elements of adequate housing as enumerated by the Habitat Agenda, the specific method employs a combination of elements of a cross-sectional analytic approach, in which differences in household composition are contrasted between physical housing attributes and level of services, and other relevant components such as economic status and access to household assets and some features of longitudinal measurement.

### 2.3 Limitations

While applying the data presented in this report, it is important to recognize that a key limitation is the extent of coverage in the 2014 Census. As noted in the Union Report of the 2014 Census (Department of Population, 2015) some populations in three areas of the country were not enumerated. This included an estimate of 1,090,000 persons residing in Rakhine State, 69,800 persons living in Kayin State and 46,600 persons living in Kachin State (see the Union Report for the reasons that these populations were not enumerated). In total, therefore, it is estimated that $1,206,400$ persons were not enumerated in the Census. The estimated total population of Myanmar on Census Night, both enumerated and nonenumerated, was 51,486,253.

The analysis in this report covers only the enumerated population. It is worth noting that in Rakhine State an estimated 34 per cent of the population were not enumerated as members of some communities were not counted because they were not allowed to self-identify using a name that was not recognized by the Government. The Government made the decision in the interest of security and to avoid the possibility of violence occurring due to intercommunal tension. Consequently, data for Rakhine State, as well as for several Districts and Townships within it, are incomplete, and only represent about two-thirds of the estimated population.

## Chapter 2. Methodology and data assessment

Limitations relating to the collection of information on a number of particular housing variables, such as the use of electricity as a source of lighting and cooking; the concept of piped water; and the enumeration of homeless people and persons in other collective quarters are highlighted in the relevant chapters and sections of this report.

## Chapter 3. Household characteristics

The household, a basic socioeconomic unit in all countries, is often central to the study of social and economic development. The number, size and structure of households and changes in the rate of household formation are useful for planning and for developing special policies formulated for selected groups of the population (United Nations, 2008, p 238).

Apart from the effects of demographic factors on the size and structure of households, there are other non-demographic determinants including economic conditions, the labour market, business cycles, and housing costs. Kochanowski (1995) argues that economic conditions and growth play a major role in cohabitation and headship rates and, as such, may be better indicators of household formation.

### 3.1 Household size

One of the key indicators relating to the structure of households is average household size (which itself is the product of several demographic characteristics such as nuptiality, fertility, life expectancy and migration). Average household size is derived as the ratio of the total population enumerated in conventional households to the number of such households enumerated in an area. At the time of the 2014 Census, the average household size at the Union level stood at 4.4 persons per household. Comparing the States and Regions, Kachin and Chin recorded the highest average household sizes at 5.1, while Nay Pyi Taw, Ayeyawady and Magway had the lowest at 4.1. At the District level, Hopan (in Shan State) recorded the highest average household size at 6.3 while Hinthada (Ayeyawady Region) and Pyay (Bago Region) recorded the lowest at 3.7. Further details of household sizes are presented in Table A-4 of the Main Report (Department of Population, 2015).

Studies have established a link between age; marital status; educational level of household head; employment status; size of dwelling unit; and the number of rooms in a dwelling unit with household size (Dhabunansi, 2010). The average household size at the Union level and for urban and rural areas has oscillated around five persons over the period 1983 to 2001 but by the time of the 2014 Census, there was a noticeable drop to 4.4 (Figure 3.1). However, a notable characteristic of average household sizes in Myanmar since 1983 is that urban households have generally tended to be slightly larger than rural households. This goes against the norm in most developing countries where, due to generally higher educational levels, greater employment demands, the higher cost of housing, and other cultural factors underlying family formation, urban households tend to be smaller than rural households. For instance, in 2009, the average household size in Viet Nam was 3.66 and 3.84 for urban and rural households respectively (General Statistics Office, 2011). The departure from this norm in the case of Myanmar may be attributed to the differences in the definition of urban and rural or may be caused by the tendency for families to coalesce around, and live with, the main bread winners who most often reside in urban areas. The average household sizes for selected years from 1983 to 2014, using data from the periodic Fertility and Reproductive Health Surveys (FRHS), are shown at Figure 3.1.

## Chapter 3. Household characteristics

Figure 3.1
Average household size, 1983 to 2014

The average household size of 4.4 recorded in the 2014 Census in Myanmar is slightly higher than most countries in the South-East Asian region as can be seen from recent trends in a selection of countries shown at Figure 3.2. Of these, only the Philippines recorded a higher level.

Figure 3.2
Trends in average household size in selected countries in South-East Asian Region, 2000-2012

Source: Nakono Ltd, 2016.

Figure 3.3 shows that the results of the 2014 Census reported a shift from the 1983 situation, in that the proportion of households that comprised one or two persons increased from 13.2 to 17.0 per cent. The proportion of households that comprised three persons and four persons also rose from 13.7 per cent and 16.0 per cent to 19.9 per cent and 21.3 per cent respectively. Conversely, the proportion of larger households (comprising seven or more persons) fell from 27.6 per cent to 14.3 per cent.

## Chapter 3. Household characteristics

The numbers and proportion of households by size for States/Regions and urban and rural areas as reported in the 2014 Census are shown in Appendix 1, Table A1(a). Most States/ Regions show the highest proportion of households with four persons. However, Sagaing shows the highest proportion (17.5 per cent) of households with five persons, while Bago, Ayeyawady, and Nay Pyi Taw show the highest proportion of households with three persons, recording 22.5 per cent (Bago), 22.7 per cent (Ayeyawady), and 22.3 per cent (Nay Pyi Taw) respectively.

The numbers and proportion of households by household size for Districts are presented in Appendix 1, Table A1(b). Laukine (Shan State) shows the highest proportion of households with six persons at 16.8 per cent, while Thayet (Magway Region) and Pyay (Bago Region) show the highest proportion of households with three persons, recording 25.5 per cent (Thayet) and 27.3 per cent (Pyay) respectively.

Figure 3.3
Percentage of households by number of persons in the household, 1983-2014

### 3.2 Household structure

### 3.2.1 Household classification and type

The United Nations guidelines for population and housing censuses recommend that households should be classified according to the number of family nuclei they contain and the relationship, if any, between the family nuclei and other members of the household (United Nations, 2008, p 132). ${ }^{3}$ Classification of households by relationship to the head provides an intricate structure of households especially as it relates to family dynamics which are useful in assessing housing requirements in any community. Taking into consideration sociocultural and economic factors, a household consisting of a couple ${ }^{4}$ and their children should ideally have at least two bedrooms; one for the parents and one for the children.

[^2]
## Chapter 3. Household characteristics

In the 2014 Census, the United Nations classification has been slightly modified, but the resulting output categories (shown at Table 3.1) remain largely consistent with the United Nations recommendations.

Table 3.1
Distribution of households by household composition type, 2014 Census

| Household composition type | Number | Percentage |
| :--- | ---: | ---: |
| All households | $\mathbf{1 0 , 8 7 7 , 8 3 2}$ | $\mathbf{1 0 0 . 0}$ |
| Couple households | $\mathbf{7 , 6 4 9 , 4 9 1}$ | $\mathbf{7 0 . 3}$ |
| 1. Couple only | 731,646 | 6.7 |
| 2. Couple + child(ren) only | $4,500,948$ | 41.4 |
| 3. Couple + child(ren) + other relatives only | $1,875,367$ | 17.2 |
| 4. Couple + child(ren) + non-relatives only | 115,327 | 1.1 |
| 5. Couple + child(ren) + other relatives + non-relatives | 102,090 | 0.9 |
| 6. Couple + other relatives only | 265,035 | 2.4 |
| 7. Couple + non-relatives only | 29,504 | 0.3 |
| 8. Couple + other relatives + non-relatives only | 29,574 | 0.3 |
| Non-couple households | $\mathbf{3 , 1 6 6 , 7 4 8}$ | $\mathbf{2 9 . 1}$ |
| 9. Lone persons only | 501,088 | 4.6 |
| 10. Lone head + child(ren) only | 951,665 | 8.7 |
| 11. Lone head + child(ren) + other relatives only | $1,006,568$ | 9.3 |
| 12. Lone head + child(ren) + non-relatives only | 24,442 | 0.2 |
| 13. Lone head + child(ren) + other relatives + non-relatives | 45,956 | 0.4 |
| 14. Lone head + other relatives only | 531,278 | 4.9 |
| 15. Lone head + non-relatives only | 52,836 | $\mathbf{6 1 , 5 9 3}$ |

Using this classification, the results of the 2014 Census showed that the more common household composition types (numerically) were: couples living with children only; couples living with children and other relatives; lone heads living with children and other relatives; and lone heads living with children only. Specifically, the 2014 Census reported that couples living with children only ( 41.4 per cent) and couples living with children and other relatives (17.2 per cent) formed the greatest proportion (58.6 per cent in total) of households in Myanmar. This profile was reflected uniformly in all States/Regions with the proportion of households comprising these two largest composition types being highest in Shan ( 63.4 per cent) and lowest in Yangon (53.6 per cent).

It is suggested that the provision of housing in Myanmar should be re-oriented to reflect the needs of these two dominant household composition types, since for almost 60 per cent of households, nationally and in States/Regions, the bulk of housing accommodation should contain a minimum of two bedrooms; one of which may be used by the children and the other by the parents.

The proportion of couple only households at the Union level stood at 6.7 per cent with Kachin recording the lowest proportion at the State/Region level (4.0 per cent) and Ayeyawady recording the highest proportion ( 8.7 per cent). The details of household composition types

## Chapter 3. Household characteristics

are presented in Appendix 1, Table A2.

The results (as shown at Figure 3.4) further reveal that at the Union level, 4.6 per cent of households were comprised of lone persons only. At the State/Region level, this proportion ranged from 3.8 per cent in Shan State to 6.0 per cent in Nay Pyi Taw.

Figure 3.4
Percentage of households by composition type, 2014 Census

### 3.2.2 Household heads by age and sex

Changes in the age distribution of a population often lead to shifts in the average household size as different age groups have different propensities to form households (University of Florida, 2006). This effectively affects housing consumption parameters. Figure 3.5 shows that the number of household heads increases with age from just 47,369 for the youngest heads aged 15-19 up to 1,317,723 for the age group 45-49, which constitutes 12.1 per cent of all household heads $(10,873,181)$. Thereafter the number of household heads diminishes with age. This general profile is mirrored in both urban and rural areas as presented at Figure 3.5 and Appendix 1, Table A3.

For household heads of all age groups, there were more males than females, though the differential was less in urban areas than in rural areas, and diminished with age as higher male mortality took effect. Figure 3.6 shows that the percentage of households headed by females decreased with age up to 30-34 years at 13.6 per cent. After that, it continued to increase with age. The percentage of female-headed households by age was consistently higher across all age groups in urban areas.

## Chapter 3. Household characteristics

Figure 3.5
Number of household heads by age, urban and rural areas, 2014 Census

Figure 3.6
Percentage of female-headed households by age, urban and rural areas, 2014 Census

Levels and trends in female-headed households are particularly important indicators of changes in family organization and in the process of family formation (Arias and Palloni, 1996). Trends and dynamics of household composition have a relationship with housing given that incomes and other socioeconomic characteristics of households affect their housing choices and affordability.

Arias and Palloni further assert that it is difficult to assess levels of female-headed households due to disagreements among social scientists concerning the appropriate definition and measurement of female headship. Arguing that censuses 'misdiagnose' the problem by allowing household members to designate a household head, numerous social scientists use

## Chapter 3. Household characteristics

alternative criteria to determine what constitutes a female-headed household. They suggest that one of the chief difficulties of measurement has to do with the fact that census counts do not identify, as heads, women who bear the chief economic responsibility for a household but reside with adult males who are deemed to be the head due to definitional instructions.

It should nonetheless be acknowledged that this bias in the measurement of prevalence of female headship is usually offset when women counted as heads reside alone only temporarily while their spouses or male partners are away and provide full or partial economic support through remittances. Therefore, in most less developed countries, on balance, censuses are the best source of a universal estimation of the prevalence of female-headed households.

The 2014 Census reported that 23.7 per cent of households at the Union level were headed by females. A higher percentage of female-headed households was recorded in urban areas (27.7 per cent) compared to rural areas ( 22.2 per cent). This may be attributable to the fact that in urban areas, women are more likely to secure employment and, as a consequence therefore, be more likely to establish households. This scenario also may be due to less cultural influences in urban areas compared to rural areas, which enable women to establish and manage households in their own right.

Numbers and proportions of households by age and sex of household head, urban and rural areas and State/Region and District are presented at Appendix 1, Table A3. At the State/ Region level, the proportion of female-headed households ranged from 19.3 per cent in Ayeyawady Region to 28.9 per cent in Tanintharyi Region; data at the State/Region level are presented at Figure 3.7. At the District level, the proportion of female-headed households ranged from 9.6 per cent in Makman (Shan State) to 38.7 per cent in Pharpon (Kayin State).

## Chapter 3. Household characteristics

Figure 3.7
Percentage of female-headed households, State/Region, 2014 Census

## Chapter 3. Household characteristics

### 3.3 Household formation and headship

### 3.3.1 Household formation

To paraphrase Burch and Mathews 1987, household formation is the process and results of decisions made by individuals, couples and households with regard to "at what point in time and with whom and where they shall live and share the daily processes associated therewith". Such processes and decisions are no doubt influenced by the dynamics of housing markets among other economic, social, environmental and demographic factors.

The 2014 Census recorded some 10, 877,832 conventional households - an increase of almost 4.4 million from the $6,495,621$ reported in the 1983 census. This reflects an annual growth rate of 1.67 per cent.

### 3.3.2 Headship rates

Headship and home acquisition are both reversible conditions, meaning that there can be transitions into and out of either state, unlike some other life course events such as completing high school, getting married for the first time, or having a first child (Goodman, Pendall and Zhu, 2015).

It is to be expected that, generally, young people will generate new households while older people make transitions out of headship as their economic status and responsibilities change. However, in certain circumstances, and especially in less developed countries, this is sometimes not the case given the delay in young people getting jobs and accumulating the resources to purchase/own a house. Headship rates are important because they help house builders and city planners determine how many households are forming that will need housing in the future.

At the time of the 2014 Census, the headship rate (defined as the ratio of the number of household heads to the size of the adult population) at the Union level stood at 0.32, while at the State/Region level the rate ranged from 0.29 in Kachin to 0.35 in both Ayeyawady and Nay Pyi Taw. Social change generally reduces the rate of headship at young ages, as people wait longer to form families for economic and cultural reasons (Bonvalet and Lelievre, 1997, cited in Monkkonen, 2013). The age-specific headship rates in Myanmar broadly conform to this norm where the rate peaks at around 0.6 between the ages of 60-69 at the Union level and in most States/Regions, as shown at Figure 3.8 and Table 3.2.

## Chapter 3. Household characteristics

Figure 3.8
Age-specific headship rates, State/Region, 2014 Census

Comparing the urban and rural rates, interestingly, the pattern remains somewhat similar to the profile at the Union level with the headships peaking at about 0.6 at ages 65-74 in both areas. As Figure 3.9 shows, in essence, there is no distinct difference in headship rates between rural and urban areas though the rates for urban areas generally remain slightly lower than for rural areas up to age 65-69 where the headship rates for rural and urban areas converge. After this age group, the headship rates for urban areas marginally exceed the rates for rural areas up to the more advanced ages.
Table 3.2

## Chapter 3. Household characteristics

Figure 3.9
Age-specific headship rates, urban and rural areas, 2014 Census

## Chapter 4. Tenure conditions and dwelling types

### 4.1 Introduction

Household tenure in a census refers to the status of the arrangements under which a household occupies all or part of a dwelling unit. The unit of enumeration is a household occupying a housing unit (United Nations, 2008). It refers to the ownership or rental status of the household with respect to the dwelling in which the household members live. It does not address itself to strict legal status but rather to the clarity of, and predictability of terms of, the occupation of the dwelling. Households can be very broadly classified into two main tenure categories:
(a) Owner occupied: where the head and/or any other member(s) in the household owns the dwelling unit. This includes those dwelling units that have been paid in full as well as those with outstanding housing loans or mortgages.
(b) Renting: where the head and/or any other member(s) in the household rents the whole or part of the dwelling unit.

A copy of the question that captured information on tenure in the 2014 Census is shown at Q33 at Figure 1.2.

### 4.2 Tenure status

### 4.2.1 Levels of home ownership

In general, the 2014 Census reported encouraging results with regard to the proportion of households that own their dwellings. At the Union level, a significant 85.5 per cent of households owned their dwelling, while only 7.4 per cent rented their dwelling. However, in urban areas, though a majority ( 66.0 per cent) of households owned their dwellings, a sizable 20.3 per cent rented their dwellings compared to rural areas where 93.1 per cent owned their dwellings while only 2.4 per cent rented them. The details are presented in Appendix 1, Table A4.

All the States/Regions recorded levels of ownership between 64 per cent and 94 per cent with Ayeyawady Region recording the highest level at 93.8 per cent and Yangon Region the lowest at 64.5 per cent (Figure 4.1).

The high percentage of households owning their dwellings in Regions such as Ayeyawady may be attributable to the availability of commonly used building materials, such as timber, bamboo and dhani/theke leaves, while the comparative lower levels of ownership in Yangon is largely attributable to its urban nature which renders the traditional construction of household dwellings less practicable than in other, more rural, parts of the country.

## Chapter 4. Tenure conditions and dwelling types

Figure 4.1
Percentage of households owning or renting, urban and rural areas, State/Region, 2014 Census

### 4.2.2 Tenure status by sex of household head

In less developed countries, there are at least two routes to become a homeowner. The first route that is shared with more developed countries is the buying of a complete house. This comes with a minimum entry cost that in the absence of well-functioning mortgage-backed credit markets is likely to exclude a significant proportion of the population. The second route involves occupying a substandard unit and, over time, building and improving the structure. This second route, however, comes at a cost of substandard housing (Gandelman, 2009).

These two means of acquiring home ownership clearly would pose a challenge to women who head their households mainly due to issues of employment, access to credit and collateral for the first option, and cultural factors for the second option. This, therefore, is the basis for evaluating the relationship between the sex of heads of households and tenure.

The results of the 2014 Census show that out of the 9.3 million households at the Union level who reported that they owned their dwellings, 24.2 per cent were female-headed while 75.8 per cent were male-headed (Figure 4.2). The proportion of female-headed owners is a little lower in rural areas ( 22.5 per cent) and correspondingly higher in urban areas ( 30.5 per cent).

## Chapter 4. Tenure conditions and dwelling types

Figure 4.2
Percentage of households by tenure by sex of head, urban and rural areas, 2014 Census

Table 4.1
Percentage of households by tenure by sex of head, urban and rural areas, 2014 Census

| Tenure Status | Union |  |  | Urban |  |  | Rural |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total | Male heads | Female heads | Total | Male heads | Female heads | Total | Male heads | Female heads |
| Total | 10,873,181 | 8,294,531 | 2,578,650 | 3,048,317 | 2,204,153 | 844,164 | 7,824,864 | 6,090,378 | 1,734,486 |
| Per cent | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 |
| Owner | 85.5 | 85.0 | 87.3 | 66.0 | 63.5 | 72.7 | 93.1 | 92.7 | 94.5 |
| Renter | 7.4 | 7.6 | 6.9 | 20.3 | 21.6 | 16.8 | 2.4 | 2.5 | 2.1 |
| Provided free (individually) | 2.5 | 2.5 | 2.4 | 4.4 | 4.5 | 3.9 | 1.8 | 1.8 | 1.7 |
| Government quarters | 3.3 | 3.5 | 2.5 | 7.0 | 7.7 | 5.2 | 1.8 | 2.0 | 1.2 |
| Private company quarters | 0.7 | 0.8 | 0.4 | 1.0 | 1.2 | 0.5 | 0.6 | 0.7 | 0.3 |
| Other | 0.6 | 0.6 | 0.5 | 1.3 | 1.4 | 0.9 | 0.3 | 0.4 | 0.3 |

Table 4.1 shows that 85.5 per cent of households in Myanmar were owners of the housing units they live in, with this proportion being slightly higher among female-headed households (87.3 per cent) than male-headed households ( 85.0 per cent), and higher in rural areas ( 93.1 per cent) than in urban areas ( 66.0 per cent). The gender differentials are observed in both urban and rural areas, as shown in Appendix 1, Table A5.

### 4.2.3 Tenure status by age of head of household

Figure 4.3 illustrates the profile of tenure by the age of the head of household. While 14.6 per cent of household heads who owned their dwellings were in the age group 25-34, over a quarter of renters ( 27.4 per cent) were of the same age group. These results reinforce the

## Chapter 4. Tenure conditions and dwelling types

general observation that access to finances for housing especially between the ages of 25 and 34 years, when most people are just starting their working career, is usually a challenge. At ages 45-54, when people are generally more economically established, the pattern is reversed, and the Census reported that 24.2 per cent of all owners were in this age group while only 20.4 per cent were renters. Detailed figures are presented by sex of household head in Appendix 1, Table A5.

This pattern is broadly replicated in both urban and rural areas where, as in the case at the Union level, the disparity between the proportion of renting household heads and owning household heads is greatest between the ages of 25 and 34 years. The results are summarized at Table 4.2.

Figure 4.3
Percentage of households by tenure by age of head, urban and rural areas, 2014 Census

| Total | 100 | 3.3 | 17.0 | 23.6 | 23.6 | 18.0 | 14.4 |
| Owner | 100 | 2.9 | 15.9 | 23.3 | 24.0 | 18.7 | 15.2 |
| Renter | 100 | 9.5 | 31.1 | 27.1 | 18.2 | 9.8 | 4.3 |
| Provided free (individually) | 100 | 11.6 | 35.1 | 27.6 | 14.3 | 6.9 | 4.4 |
| Government quarters | 100 | 5.9 | 29.0 | 30.2 | 22.9 | 10.2 | 1.9 |
| Private company quarters | 100 | 10.6 | 31.8 | 27.1 | 18.3 | 9.2 | 3.0 |
| Other | 100 | 8.9 | 28.0 | 27.3 | 19.3 | 10.9 | 5.4 |

Table 4.3 shows that housing ownership increases with age in Myanmar, rising from 68.7 per cent among heads of households aged 15-24 to 94.9 per cent among those aged 65 and over, and this pattern is similar among both male- and female-headed households. Correspondingly, the proportion of households living in rented housing units declines with age, falling from 16.5 per cent among heads aged 15-24 years to just 3.0 per cent among those aged 65 and over. Again, this pattern is observed among both male- and female-headed households. The very much smaller proportions of households living in 'Private company quarters' also declines with increasing age from 2.2 per cent for heads aged 15-24 to just 0.2 per cent for those aged 65 and over, by which age very few heads are still in government service. The age differentials are also observed in both urban and rural areas (Figure 4.4) as well as across States/Regions (Appendix 1, Table A5).

## Chapter 4. Tenure conditions and dwelling types

### 4.2.4 Tenure and economic activity of household head

Given that to rent or own a dwelling unit requires varying levels of income or financial capacity, this report attempted to establish the relationship between tenure and economic activity. The findings show that a significant proportion of households that rent ( 73.3 per cent) or own ( 63.7 per cent) their dwellings were either employees in private companies or own account workers. This notwithstanding, two in five of those renting their dwellings (42.3 per cent) were employees in private companies. The results are presented at Figure 4.5 and in Appendix 1, Table A6(a).

Figure 4.5
Percentage of households by tenure by economic activity of head, 2014 Census

Most notable in Figure 4.6 is that the majority of government employees, not surprisingly, reported living in government quarters (58 per cent). For all other activity statuses owners were the most dominant tenure group ranging from 76.6 per cent of private employees to 94.3 per cent of contributing family workers.

## Chapter 4. Tenure conditions and dwelling types

Figure 4.6
Percentage of economically active heads of household by activity status by tenure, 2014 Census

### 4.2.5 Tenure and construction materials

Gandelman (2009) asserts that for many households, especially in the case of substandard dwellings in less developed countries, a common route for ownership of the dwelling is the occupation of the unit and, over time, rebuilding and improving the structure. This route to ownership, however, comes at a cost of substandard housing. There is therefore a need to ensure that the dwellings owned by households are up to a minimum standard. Generally, the census indicator that comes closest as a measure of the condition of housing and attendant standards is the material used to construct the walls. On this basis, this report examines the main construction material of the walls of housing units in which households live as well as the relationship between ownership and construction materials.

The Census reported that most households live in housing units where the walls are constructed from bamboo ( 51.2 per cent) and wood materials ( 21.6 per cent) (Figure 4.7). These construction materials can generally be considered as temporary, whereas one in six households (15.9 per cent) live in housing units where the main construction material of the walls is tile/brick/concrete, which is considered more durable.

## Chapter 4. Tenure conditions and dwelling types

Figure 4.7
Percentage of households by main construction material of walls of housing units, 2014 Census

Figure 4.8 shows that a large majority (85.6 per cent) of households who own their dwellings reported living in houses where walls were constructed from dhani/theke, bamboo and wood. While it is not necessarily the case that such basic materials denote poor quality, this nevertheless is a finding of some concern since the probability is that some of this stock may need replacement within a short period of time (typically less than ten years). By far, the largest proportion of housing with walls constructed from tile/brick or concrete materials (67.8 per cent) was reported as being government quarters. The detailed results are shown in Appendix 1, Table A6(b).

## Chapter 4. Tenure conditions and dwelling types

Figure 4.8
Percentage of households by tenure by construction materials of walls of housing units, 2014

## Census

### 4.3 Type of Housing Units

Type of dwelling refers to the kind of housing occupied by a household. The main dwelling type classification adopted in the 2014 Census were:

- Condominium
- Apartment/flat
- Bungalow/brick house
- Semi-pacca house
- Bamboo
- Hut 2-3 years
- Hut 1 year
- Other.

Most households in Myanmar live in wooden (41.2 per cent) or bamboo houses ( 37.4 per cent), with some differences between urban and rural areas (Figure 4.9). A higher proportion of households in rural areas reported living in such types of housing units ( 85.4 per cent in total) than in urban areas ( 61.0 per cent in total). There were, conversely, more households in urban areas living in condominiums/apartments/flats and bungalows/brick houses (just over a quarter) than in rural areas (one in twenty). Figure 4.9 shows no gender differentials when looking at the sex of household head.

## Chapter 4. Tenure conditions and dwelling types

Figure 4.9
Percentage of households by type of housing unit, urban and rural areas and sex of household head, 2014 Census

## Chapter 5. Building materials

### 5.1 Concept of durability

The durability of any building construction may be defined as. "The ability of the construction to maintain its required performance over a given or long time, under the influence of foreseeable actions". This is determined by a combination of factors including the nature of materials used; its design and adherence to construction procedures and practice; appropriate maintenance standards and procedures; as well as the level and nature of exposure to climatic and environmental peculiarities.

UNESCO (2015) suggests that a house is considered as 'durable' if it is built on a nonhazardous location and has a permanent structure and is adequate enough to protect its inhabitants from the extremes of climatic conditions such as rain, heat, cold or humidity. According to the United Nations guidelines, 'durability', when referring to wall/roof/floor materials, refers to "... the period of time for which the structure remains habitable, subject to regular maintenance. A durable structure therefore is one expected to remain sound for a considerable period of time." (United Nations, 2008, p 212). The United Nations goes on to note that, for the purposes of a census, the specific duration may be defined by countries, but recommends a period of 15-20 years.

Durability does not, however, depend solely on the materials used in construction, since it is also affected by the way the building was erected, that is to say, whether or not it was built according to construction standards and regulations. Subject to normal maintenance, a building should be properly designed and works executed to fulfil requirements of the building code for an economically reasonable period of time (working life of the building). Durability is thus further dependent on the intended use of the building and its maintenance or service conditions.

However, information on durability based on these two criteria were not collected in the 2014 Census, and therefore this report adopts, instead, the main type of materials used in the construction of a dwelling as a proxy measure.

It should be recognized that some traditional and indigenous materials, though generally considered less durable, none the less provide better thermal comfort than more modern building materials in some circumstances. Furthermore, recent technological developments in treating traditional building materials, such as bamboo, have extended the durability of such materials. In most instances, the construction material of outer walls may be considered as an indicator of the building's durability.

The assessment of the durability of a building material can relate to the material as a whole or to its performance characteristics, insofar as these play a significant part with respect to the fulfilment of the requirements of the building code. In either case, the underlying assumption is that the performance of the material will be maintained to an acceptable level, in relation to its initial performance, throughout the life of the building. Accordingly, in this report, dwelling units have been classified as 'permanent', 'semi-permanent' or 'temporary' depending on the predominant construction materials of their walls and roof (Table 5.1).

## Chapter 5. Building materials

## Table 5.1

Classification of walls and roofing materials

|  | Permanent | Semi-permanent | Temporary |
| :--- | :--- | :--- | :--- |
| Roofing <br> materials* | Tile/Concrete/Brick/Corrugated iron sheet | Wood/Bamboo | Dhani/Theke/In Leaf |
| Wall <br> materials | Tile/Concrete/Brick/Wood** | Bamboo/Corrugated iron sheet/Earth | Dhani/Theke/In Leaf |

* The design of the Census question also offered 'Earth' as a possible response option for Roof, but this was not regarded as a viable roofing material and any such responses were classified as 'other'.
** In Myanmar, hard wood is widely used in building residential units in a suspended way which may allow the structure to last for over 10 years with very minimal maintenance.

### 5.2 External wall materials

A little under two in five households in the country ( 37.5 per cent) live in housing units with walls that are made of permanent materials, while just over a half ( 51.9 per cent) live in housing units where the wall material is semi-permanent. Figure 5.1 shows that, as might be expected, proportionately more dwellings in urban areas had walls constructed from permanent materials ( 56.4 per cent) than in rural areas ( 30.2 per cent).

At the State/Region level, Kayah had the highest proportion of households whose dwellings had walls constructed from permanent materials ( 67.8 per cent) while Magway had the lowest proportion (22.2 per cent). The high percentage in Kayah - higher than might be expected given its predominantly rural nature - is largely attributable to the categorization of wood as a permanent material. Indeed, nearly half of the households in Kayah lived in dwellings with wooden walls.

Figure 5.1
Percentage of households by durability of wall materials, urban and rural areas, State/Region, 2014

## Census

## Chapter 5. Building materials

The disparity in dwellings with walls constructed from a permanent material at the District level was even greater, with Hakha (Chin State) reporting the highest proportion of households living in such dwellings ( 90.5 per cent) compared with Minbu (Magway Region) at only 13.7 per cent. But it is important to interpret these results with the understanding that wood, especially hard wood which is widely used in building residential quarters in Myanmar, can usually last sufficiently long enough to be regarded as 'permanent' if dwellings are constructed in non-hazardous locations and accorded basic maintenance routines. The results are presented in full in Appendix 1, Table A7(a).

### 5.3 Roofing materials

In considering the quality of roofing materials, Figure 5.2 shows that 63.6 per cent of households at the Union level had permanent roofs. Again, the proportion of such households was higher in urban areas ( 85.7 per cent), than in rural areas ( 55.0 per cent), though it is to be noted that in both areas the extent of permanent roofing was significantly higher than the extent of permanent walls described above. Although these generally higher levels of permanent roofing were evident in almost all States/Regions, Figure 5.2 shows that in Rakhine State the level of permanent roofing (at just 27.2 per cent) was a notable exception. But caution should be taken in interpreting this extreme figure as there was a significant level of non-enumeration in certain parts of the State.

What cannot be questioned, however, is the particularly high level of permanent roofing at the District level, reported in West Yangon (97.4 per cent of households). This is in stark contrast to Myeik (Thanintharyi Region) which had the lowest proportion of such households at just 18.3 per cent. The data for all Districts is given at Appendix 1, Table A7(b).

It must be emphasized, once more, that in interpreting these results for roofing materials the households with less permanent, mostly traditional materials that may not provide longevity, may nevertheless provide better thermal comfort than more durable materials. The main departure when comparing the traditional high maintenance materials (such as Dhani/Theke) to modern low maintenance materials (such as corrugated iron sheets) is the endurance of the materials when exposed to the vagaries of the weather and the environment.

## Chapter 5. Building materials

Figure 5.2
Percentage of households by durability of roofing materials, urban and rural areas, State/Region, 2014 Census

### 5.4 Floor materials

Floor materials of dwellings are crucial for hygiene and the control of communicable diseases in households and neighbourhoods. For instance research has associated jigger infestation to poverty and poor housing conditions (Kamau et al, 2014).

Figure 5.3 shows that most households at the Union level reported that they had finished floor materials made predominantly of wood or bamboo. Specifically, 51.0 per cent of households had a wooden floor while only 8.0 per cent had an earth floor, which is usually regarded as the most unhygienic type of floor finish. The profile in both urban and rural areas is broadly the same as the picture at the Union level, except that a notably higher proportion (34.0 per cent) of households in urban areas live in dwellings with concrete/tile floors.

## Chapter 5. Building materials

Figure 5.3
Percentage of households by type of floor materials, urban and rural areas, State/Region, 2014

## Census

The results of the Census at the State/Region level are varied but do not diverge greatly from the profile at the Union level. Most States/Regions except Mandalay, Magway and Shan had over 45 per cent of their households living in dwellings with wooden floors. Incidentally, most States/Regions did not record high proportions of households in dwellings with an earthen floor with the exception of Sagaing, Mandalay and Shan where significant proportions of households (26.0 per cent, 23.0 per cent and 11.0 per cent respectively) were recorded. The detailed results for all States/Regions and Districts are presented in Appendix 1, Table A7(c).

## Chapter 6. Household amenities and assets

### 6.1 Water supply and sanitation

To facilitate national and subnational monitoring of attainment of national goals and policies as well as for reporting and assessing international comparisons with respective international goals - especially the 2030 Agenda for Sustainable Development - the analysis of water and sanitation in this thematic report is guided by the WATSAN Ladder developed by the WHO/ UNICEF Joint Monitoring Programme (WHO/UNICEF, 2008) as depicted at Table 6.1.

According to WHO (2015), Myanmar set a national coverage target in 2011 for access to improved water and sanitation services for 90 per cent of the population by 2015. And according to the Multiple Indicator Cluster Survey 2009-2010 (MICS) (UNICEF, The Ministry of Health and the Ministry of National Planning and Economic Development, 2011) 82.3 per cent of the population of Myanmar use an improved source of drinking water: 93.2 per cent in urban areas and 77.6 per cent in rural areas.

However, it is generally recognized that the main source of drinking water of the population varies across States/Regions. In general, from existing data, urban areas have better access to improved piped water than rural areas.

It should be noted here that the categories of drinking water that have been used to define 'improved' sources in the 2014 Census are slightly different to those set out in Table 6.1. For example, the classification shown in the Table indicates that 'rainwater collection' should be included among the sources of 'improved' drinking water, but the 2014 Census treated this as an 'unimproved' source. Conversely, 'bottled water' has been treated in this report as 'improved'.

It should be further noted that the data presented in this report on the source of drinking water should be interpreted with the understanding that the normal concept of piped water may not apply in some parts of the country where some innovations are made to tap water from the mountains. Information on the frequency (in terms of hours per day) during which water is available for households was not collected in the Census. Therefore, it is assumed in this report that those households who reported to be connected to piped water have a normal or near normal supply.

## Chapter 6. Household amenities and assets

## Table 6.1

WHO/UNICEF JMP WATSAN Ladder

Source: WHO/UNICEF Progress on Drinking Water and Sanitation 2014 Update.

## Chapter 6. Household amenities and assets

### 6.1.1 Access to improved drinking water

The 2014 Census reported that 69.5 per cent of households at the Union level had access to improved drinking water sources (as defined above) while 30.5 per cent did not have such access. Comparing urban and rural areas, the results show a marked difference in the status of access to improved drinking water sources with urban areas returning better results in which 86.7 per cent of households had access to such sources compared to 62.7 per cent of households in rural areas (Figure 6.1). These results indicate that the set national goal of achieving 90 per cent access to improved drinking water sources by 2015 may be elusive. Moreover, these results contrast with the MICS figures noted above (though it is difficult to compare the two figures directly since the Census refers to 'households' while the MICS refers to population). However, if the MICS process applied the WHO/UNICEF JMP classification there may be a need for a further detailed assessment of the underlying reasons for these divergent results.

Comparing these results with the situation in the South-East Asia region, it seems that Myanmar is making good progress, (though an analysis of comparable trend data would be needed to fully substantiate this), but is still below the regional performance of its neighbouring countries in the attainment of global goals in access to improved drinking water. According to WHO/UNICEF (2015), by 2015 the South-East Asia region had attained 33 per cent access to piped water and 57 per cent access to other improved sources of drinking water giving an aggregate access to improved drinking water sources for the region of 90 per cent. The respective access rates for Myanmar, as reported in the 2014 Census, were 9.0 per cent and 60.5 per cent giving a corresponding aggregate access level of only 69.5 per cent. This reveals that while Myanmar is on a par within the region in regard to access to other improved sources of drinking water, the proportion that have access to piped water lags far behind the regional average.

Figure 6.1
Percentage of households with or without access to improved drinking water, urban and rural areas, 2014 Census

## Chapter 6. Household amenities and assets

Figure 6.2
Percentage of households with access to improved drinking water, State/Region, 2014 Census

## Chapter 6. Household amenities and assets

Levels of access to improved drinking water at the subnational level, as presented in Appendix 1, Table A8, are extremely varied. The map at Figure 6.2 shows that at the State/Region level, Nay Pyi Taw recorded the highest access to improved drinking water sources at 87.7 per cent while Rakhine recorded the lowest at 37.7 per cent. At the District level, West Yangon recorded the highest access rate to improved drinking water at 95.7 per cent while Phyapon (Ayeyawady Region) recorded the lowest at 4.0 per cent.

### 6.1.2 Access to improved sanitation

The results of the 2014 Census reveal that at the Union level, three quarters ( 74.3 per cent) of households had access to improved sanitation ${ }^{5}$. In urban areas, this proportion was much higher - an impressive 92.3 per cent - while in rural areas only two-thirds of households ( 67.3 per cent) had such access. The results are presented at Figure 6.3 and in Appendix 1, Table A8.

Figure 6.3
Percentage of households with or without access to improved sanitation, urban and rural areas, 2014 Census

[^3]
## Chapter 6. Household amenities and assets

Figure 6.4
Percentage of households with access to improved sanitation, State/Region, 2014 Census

These results suggest very good progress in attaining national and international goals of access to improved sanitation. Also, Myanmar's performance is slightly above the South-East Asian regional average, which had, by 2015, attained a level of 72 per cent (WHO/UNICEF, 2015).

## Chapter 6. Household amenities and assets

At both the State/Region and District levels, the map at Figure 6.4 shows that the Census recorded very divergent results in which some areas reported very low rates of access to improved sanitation while others reported impressively high access rates. Specifically, among the States/Regions, Yangon reported the highest access rate (at 91.1 per cent) while Rakhine had the lowest at 31.8 per cent. And among the Districts, the highest access rates (shown at Appendix 1, Table A8) were recorded in East and West Yangon (at 96.4 per cent and 96.2 per cent respectively) while Myauk U (in Rakhine State) recorded the lowest access rate at 18.7 per cent. It should be noted here, however, that the particularly low rate for Myauk $U$ is very much an outlier and may have been affected by the high level of non-enumeration there. It is significant to note that the next two Districts with the lowest access rates, Hopan (Shan) at 26.6 per cent and Sittway (also in Rakhine) at 28.3 per cent, have levels that are significantly higher than Myauk U.

### 6.2 Household energy sources

The key determinants of energy consumption in households are the needs for cooling, heating, hot-water supply, lighting and the use of electrical appliances. Of these, the energy consumption from lighting and electrical appliances have shown the biggest increases in recent years mainly due to changes in lifestyle, and the availability of, and access to, modern domestic appliances and equipment. The increase in household energy consumption is largely due to residents using lighting and electrical appliances such as televisions and cooling equipment (such as air conditioners and refrigerators).

It is estimated that household energy consumption for lighting, warmth, cooling, water heating, electronic entertainment, computing, refrigeration, and cooking constitutes between 15 to 25 per cent of the total energy consumption in most countries (United Nations, 1999).

In the 2030 Agenda for Sustainable Development, Sustainable Development Goal 7 (SDG 7) aims to: "Ensure access to affordable, reliable, sustainable and modern energy for all." Of the four elements of this goal, only two - sustainable and modern - can feasibly be measured from the 2014 Census data. Therefore, based on SDG 7, the analysis of data in this report ranks energy sources as follows, where 1 is deemed to be the best and 4 the worst.
(1) Modern and sustainable
(2) Traditional and sustainable
(3) Modern and unsustainable
(4) Traditional and unsustainable.

Using this ranking, Table 6.2 shows how the household energy sources covered in the 2014 Census have been classified.

Chapter 6. Household amenities and assets

Table 6.2
Classification of energy sources used for lighting or cooking

| Energy source | Classification |  |
| :--- | :--- | :--- |
|  | Modern/Traditional | Sustainability |
| Electricity | Modern | Sustainable |
| Liquefied petroleum gas (LPG) | Modern | Sustainable |
| Solar | Modern | Sustainable |
| Candle | Modern | Unsustainable |
| Battery | Modern | Unsustainable |
| Generator | Modern | Unsustainable |
| Kerosene | Modern | Unsustainable |
| Water Mill | Traditional | Sustainable |
| Biogas | Traditional | Sustainable |
| Coal | Traditional | Unsustainable |
| Firewood | Traditional | Unsustainable |
| Charcoal | Traditional | Unsustainable |
| Straw/Grass | Traditional | Unsustainable |
|  |  |  |

Although access is a critical component of SDG 7, this analysis will not address itself to access as such since this can be defined in a number of ways that vary with respect to: who is the targeted beneficiary (for example, individual households or whole villages); the types of energy supply that are included (such as grid-connected or off-grid electricity); and the characteristics of services that make it accessible (such as affordability, reliability, quality and adequacy). Moreover, though indicators of access are important for assessing the progress of policies, projecting demand and investment requirements, and in making international comparisons, the measurement of access is complicated by the subjectivity in its definition. It is widely accepted that access ought to encompass an affordable and reliable supply of energy services with minimal adverse impacts on both users and the environment. However, the lack of reliable data on actual service conditions prevents the widespread use of such inclusive measures of access. Furthermore, different indicators of access are adopted in different countries, making comparisons particularly challenging. For instance, some countries often present rural electrification rates in terms of the number of villages with access to electricity, but differ in their implicit definition of an 'electrified village' (Pachauri and Mueller, 2008). For example, India used to consider a village electrified even if no households had access to electricity, while in Cambodia, the government counted only grid-connected villages even though a large number of villages had micro-grids served by independent operators.

The energy ladder model envisages a three-stage fuel switching process. The first stage is marked by universal reliance on biomass. In the second stage households move to 'transition' fuels such as kerosene, coal and charcoal in response to higher incomes and factors such as deforestation and urbanization. In the third phase, households switch to Liquefied Petroleum Gas (LPG), natural gas, or electricity. The main driver affecting the movement up the energy ladder is hypothesized to be income and relative fuel prices (Leach, 1992; Barnes, Krutilla, and Hyde, 2002; Barnes and Floor, 1999, cited in Heltberg, 2003).

## Chapter 6. Household amenities and assets

It should be noted that when considering the energy sources in this section of the report, the data on electricity is understood to mean electricity supplied to households from the national grid not withstanding that, in some instances, the generation of electricity for the national grid may initially originate from different sources including hydro and wind power and sometimes diesel engines. Moreover, as information on the frequency of supply of electricity (in terms of hours per day) was not, as with drinking water above, collected in the Census, it is assumed that those households who were reported to be connected to electricity have a normal or near normal supply.

### 6.2.1 Cooking fuel

The 2014 Census data revealed that, at the Union level, only 16.8 per cent of households reported using modern and sustainable energy sources for cooking while more than four fifths ( 81.4 per cent) used traditional and unsustainable sources (Figure 6.5). These results suggest an enormous challenge to those stakeholders concerned with initiating urgent measures to reshape and fast-track Union interventions towards attainment of national and international goals on access to modern and sustainable energy. A comparison of the results between urban and rural areas does not present an encouraging picture. Even in urban areas, more than half of all households ( 52.8 per cent) use traditional and unsustainable energy sources while more than nine in ten rural households ( 92.5 per cent) do so.

Figure 6.5
Percentage of households by main type of cooking fuel, 2014 Census

The map at Figure 6.6 shows that the more urbanized States/Regions such as Mandalay, Yangon and Nay Pyi Taw generally have higher proportions of households using modern and sustainable sources of energy for cooking, although Kayah State also exhibits a higher than average level.

A comparison at the District level reveals, as with other measures, very varied levels of use of modern and sustainable energy sources for cooking by households, with urban West Yangon

## Chapter 6. Household amenities and assets

recording the highest percentage at 86.9 per cent while rural Mawlaik (Sagaing Region) reported the lowest percentage; less than 1 per cent ( 0.2 per cent). The detailed results are presented in Appendix 1, Table A9.

Figure 6.6
Percentage of households with access to modern and sustainable energy sources for cooking, State/Region, 2014 Census

## Chapter 6. Household amenities and assets

### 6.2.2 Energy for lighting

About two in five households at the Union level (41.1 per cent) reported using modern and sustainable sources of energy for lighting, with this proportion being higher in urban areas (more than three quarters ( 78.9 per cent)) than in rural areas (just over a quarter ( 26.4 per cent)) (Figure 6.7). These results show higher use of modern sustainable sources of energy for lighting compared with cooking (for example, 41.1 per cent for lighting at the Union level compared with 16.8 per cent for cooking fuels as reported above).

Figure 6.7
Percentage of households by type of energy source for lighting, urban and rural areas, 2014

## Census

However, a comparison of the results at the State/Region and District levels again presents very divergent profiles, but nonetheless mirrors the pattern of cooking fuels where households in urban areas fare better than their rural counterparts. Figure 6.8 shows that Yangon Region reported the highest level of modern and sustainable energy usage among States/Regions (70.9 per cent of households) while Tanintharyi Region reported the lowest (only 10.6 per cent of households).

## Chapter 6. Household amenities and assets

Figure 6.8
Percentage of households using modern and sustainable energy sources for lighting, State/Region, 2014 Census

## Chapter 6. Household amenities and assets

At the District level, West Yangon again reported the highest proportion of households using modern and sustainable sources of energy for lighting ( 97.5 per cent) while Kawthoung (Tanintharyi) reported the lowest level of usage ( 7.5 per cent) (see Appendix 1, Table A9).

### 6.3 Household assets

Since income permits people to obtain goods and services, household assets can often provide a more precise measure of economic well-being compared to income-based indices due to lower non-response rates (less than 1 per cent) associated with household assets variables (LAPOP, 2009).

Income and consumption data are both expensive and difficult to collect, and many otherwise useful data sources, including the Census, often lack direct measures of living standards. Moreover, the exclusion of living standard measures in multivariate analysis raises the possibility that other coefficient estimates are rendered biased. These concerns have prompted researchers to use data on household assets and other characteristics to construct alternative measures of welfare or living standards.

Household net worth, or wealth, is an important defining factor of economic well-being in any country. Often, during times of economic hardship, such as periods of unemployment, illness, or divorce, a person's or household's assets (financial or otherwise) may be sold or disposed of to generate an additional source of income to help pay expenses and bills. A person's, or a household's, wealth or net worth (that is, the difference between assets and liabilities when considered in conjunction with income) provides a better understanding of economic health and well-being (US Census Bureau, 2008). However, items which constitute assets often include interest-earning financial investments, property, vehicles and other financial assets. Household assets such as fridges, television sets, bicycles, mobile phones and so forth, which were covered in the 2014 Census, constitute only a small component of assets and are therefore limited as an absolute measure of wealth, but can, nevertheless, be valuable in measuring comparative wealth.

A critical factor for consideration in analyzing Census information and data on household assets is to differentiate between two distinct viewpoints, namely:
(a) The availability of information and communications technology (ICT) to households.
(b) Access to, and use of ICT by household members.

The distinction is important, since households need not necessarily own, but may still have access to personal computers/laptops and the internet through school/university, public access centres, and/or other households. The question was framed in the 2014 Census as: "Which of the following items does your household have?" (See Q39 at Figure 1.2).

This report therefore presents the Census results with regard to access or use of household items under the following categories:
(1) Internet and personal computers/laptops: this includes access to personal computers and the availability of the internet at home.

## Chapter 6. Household amenities and assets

(2) Electronic communication devices: these include televisions, radios, mobile phones ${ }^{6}$, and landline phones.
(3) Mobility/transportation items: these include cars, pick-up vans, motorcycles, mopeds, tuk tuks, bicycles, four-wheel tractors, motor boats and carts (bullocks).

It should also be noted here that only assets that were functioning were reported.

### 6.3.1 Access to information and communications devices

The 2014 Census results reveal that at the Union level almost half of all households ( 49.5 per cent) have access to a television. In urban areas, a little over three quarters of households ( 75.8 per cent) had such access (Figure 6.9). Figure 6.9 also shows that access to radios is higher ( 35.5 per cent) than that of mobile phones ( 32.9 per cent) at the Union level, but that this position is reversed for urban households among whom almost two-thirds (63.5 per cent) have access to mobile phones while only 27.2 per cent have access to radios. However, this result should be understood in light of the fact that most modern mobile phones have a radio function as a standard feature. Figure 6.9 also clearly shows the far greater prevalence of mobile phones over landline phones - a phenomenon which is now common in less developed countries.

Figure 6.9 shows that of the other electronic equipment items in the Census questionnaire, 6.2 per cent of households had access to the internet and 3.5 per cent had access to a computer. However, it is worth noting that most of the 3.5 per cent who have access to a computer are likely to have been a subset of the 6.2 per cent who reported having access to the internet, implying that at least as many people had access to the internet without having a computer.

Figure 6.9
Percentage of households with access to selected ICT devices, urban and rural areas, 2014 Census

[^4]
## Chapter 6. Household amenities and assets

More urban-dominated areas recorded higher percentages of households that have access to personal computers and have internet access at home. Yangon, again, reported the highest proportion of households with access to personal computers (11.1 per cent) and access to the internet at home ( 19.1 per cent), while Ayeyawady reported the lowest proportion of households with access to computers (1.1 per cent) and Chin reported the lowest level of households with access to the internet at home (1.3 per cent).

Households without any access to these information and communication devices may be deemed to be the most economically deprived and would probably be living below the poverty line. Table 6.3 shows that at the Union level, 30.3 per cent of households reported that they did not have access to any of the electronic communication devices covered by the Census or access to the internet. The results further show that, proportionately more than twice as many households in rural areas were deprived in this way compared with their urban counterparts (36.4 per cent and 14.8 per cent respectively).

Table 6.3
Percentage of households with access to none, or at least three, of the ICT devices, urban and rural areas, State/Region, 2014 Census

| State/Region/Area | Total number of households | Percentage of households with access |  |
| :---: | :---: | :---: | :---: |
|  |  | None of the ICT devices | Three or more of the ICT devices |
| UNION | 10,877,832 | 30.3 | 16.2 |
| Urban | 3,049,433 | 14.8 | 32.8 |
| Rural | 7,828,399 | 36.4 | 9.8 |
| State/Region |  |  |  |
| Kachin | 269,365 | 22.5 | 21.3 |
| Kayah | 57,274 | 32.5 | 13.6 |
| Kayin | 308,041 | 40.6 | 9.9 |
| Chin | 91,121 | 57.9 | 7.7 |
| Sagaing | 1,096,857 | 31.5 | 11.1 |
| Tanintharyi | 283,099 | 33.7 | 15.2 |
| Bago | 1,142,974 | 32.0 | 12.7 |
| Magway | 919,777 | 30.3 | 12.2 |
| Mandalay | 1,323,191 | 24.0 | 19.5 |
| Mon | 422,612 | 25.5 | 15.8 |
| Rakhine | 459,772 | 55.2 | 8.1 |
| Yangon | 1,582,944 | 17.8 | 31.7 |
| Shan | 1,169,569 | 34.1 | 13.8 |
| Ayeyawady | 1,488,983 | 35.8 | 10.9 |
| Nay Pyi Taw | 262,253 | 24.7 | 20.9 |

Chin was the State/Region with the highest level of deprivation - more than half of its households ( 57.9 per cent) reported having access to none of the assets covered in the Census - and this proportion was more than two-thirds (67.4 per cent) among rural households in this State (not shown in Table 6.3 but see Appendix 1, Table A10). In line with its high level of access to ICT devices generally, Yangon reported the lowest proportion of households with access to none of the assets (17.8 per cent), though urban households in Kayah State

## Chapter 6. Household amenities and assets

recorded the lowest proportion of all, with just one in ten households reporting no access to such assets (Appendix 1, Table A10).

### 6.3.2 Access to mobility assets

The most common mobility assets reported in the Census were motorcycles/mopeds/ tuk-tuks and bicycles with, respectively, 38.7 per cent and 35.9 per cent of households with access to these assets at the Union level. Access to these mobility assets was slightly higher overall in urban areas where 41.2 per cent and 46.9 per cent of households had access to motorcycles/mopeds/tuk-tuks and bicycles respectively (Figure 6.10). Access to carts (bullock), not surprisingly, was higher in rural areas compared to urban areas.

Figure 6.10 shows that, at the Union level, the proportion of households with access to a car/ truck/van was just 3.1 per cent, less than a tenth of the proportion of households with access to a motorcycle/moped/tuk-tuk. Indeed, this level of car access is low in comparison with many other countries in the South-East Asia region. Among those countries shown in Figure 6.11, the level of car access in Myanmar was the third lowest, only higher than the levels in Bangladesh and Viet Nam.

Figure 6.10
Percentage of households with access to mobility assets, urban and rural areas, 2014 Census

Figure 6.11
Percentage of households with access to a car, selected countries in the South-East Asia region

Source: Data for all countries in this table are from the PwC report (2015), while for Myanmar the source of data is the 2014 Census.

Appendix 1, Table A11 shows the urban/rural pattern of access to mobility assets at the State/ Region level. In summarizing these data, Table 6.4 shows that motorcycles/mopeds/tuk-tuks generally remain the most commonly accessible mobility asset among households across States/Regions, with the highest level recorded in Kachin (70.1 per cent), and the lowest level recorded in Rakhine ( 11.9 per cent). Bicycles are the second most commonly accessible mobility asset, with the proportion being highest in Bago (49.9 per cent) and lowest in Chin (3.4 per cent). It is worth noting from the results in Appendix 1, Table A11 that urban Yangon reported a comparatively low percentage of motorcycles/mopeds/tuk-tuks at just 8.7 per cent compared with other large urban areas, but this can be attributed to the existing ban on motorcycles in the city. However, car access in urban Yangon is higher than in any other urban area.

## Chapter 7. Housing adequacy and quality

### 7.1 Constructing a consolidated housing quality index

One of the uses of housing censuses is the assessment of the quality of housing (United Nations, 2008, p 13). Housing quality is a comprehensive concept that determines whether or not housing is sufficient to meet recognized housing standards as well as specific household needs (Conley and McCray, 1997, p 5). It takes into account: type of construction; materials used; amount of space; available services; the condition of facilities within and outside the dwelling; function; and aesthetics among many other factors (Jiboye, 2010 p 79). In addressing housing quality dynamics in this report, it is appreciated that the complexity associated with assessing the quality of housing and human settlements represents a major sustainable developmental challenge for most less developed countries, including Myanmar, especially within the context of urbanization.

As posed by Jiboye (2010), census data can be used to construct a housing quality index to the extent of the components of the information collected. Given the information that was collected in the 2014 Census, described in the previous chapters of this report, a consolidated housing quality index (CHQI) for Myanmar was devised that combines: scores for the construction materials of the outer walls, roof and floor; the main source of energy for cooking and lighting; the source of drinking water; and the type of toilet facility. Wall, roofing and floor materials were assigned values according to their durability and applicability, based on the response options offered in the 2014 Census. These scale values are strictly ordinal and do not imply any particular implicit value. The main source of drinking water was subjected to a quality order based on the WHO/UNICEF JMP-WATSAN ladder shown at Figure 6.1, in which water from an indoor tap is considered safer than water from open sources such as rivers, lakes or ponds, for example.

The index therefore applies the concept of housing quality, as described above, within the overall framework of adequate housing as reflected in the Habitat Agenda to the extent that is possible from the 2014 Census data. The Habitat Agenda emphasizes that:

Adequate shelter means more than a roof over one's head. It also means adequate privacy; adequate space; physical accessibility; adequate security; security of tenure; structural stability and durability; adequate lighting, heating and ventilation; adequate basic infrastructure, such as water-supply, sanitation and waste-management facilities; suitable environmental quality and health-related factors; and adequate and accessible location with regard to work and basic facilities: all of which should be available at an affordable cost (UN-Habitat, 1996).

From the elements to determine adequate housing noted above, it is evident that many components can be included to generate a more appropriate housing quality index. However, it is also understood that census data, generally, may not generate enough variables to be included in such an analysis. Therefore, in preparing this report, it was acknowledged that although some frameworks for measuring housing quality include tenure as one of the variables, this was not included in this analysis since it is clear that the tenure of a household as recorded in the Census may not directly imply the quality of the dwelling occupied by the household. The fact that a household rents their dwelling does not necessarily mean that

## Chapter 7. Housing adequacy and quality

it is living in poor conditions. It is a fact that in most countries rented accommodation is normally available for all income groups, and what normally limits households to accessing the best rental housing is their level of earnings. Indeed, when comparing the 2014 Census data on tenure and wall materials (as a proxy for structural adequacy), the results reveal that households who rent their dwellings tend to live in better housing than those who own their dwellings.

For instance, as shown in Figure 4.8, some 12.8 per cent of households who reported that they owned their dwellings had tile/brick/concrete walls compared with 28.1 per cent of households who rented their dwellings. A key variable for determining housing quality adequate living space or over-crowding (as measured by either the number of persons per room or persons per square metre) could not be included in this index because the Census did not include a question on the number or size of habitable rooms. The variables chosen were separated into structural and service adequacy and were ranked according to their adequacy as described in Table 7.1.

## Table 7.1

Consolidated housing quality index, 2014 Census

| Quality order | Structural adequacy |  |  | Service adequacy |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Wall materials | Roofing materials | Floor materials | Drinking water | Type of toilet | Cooking fuel | Source of lighting |
| 1 | Tile/brick/ concrete | Tile/brick/ concrete | Tile/brick/ concrete | Bottles | Flush | Electricity | Electricity |
| 2 | Wood | Wood | Wood | Tap water/piped | Water seal | LPG | Solar |
| 3 | Bamboo | Bamboo | Bamboo | Tube well/borehole | Pit latrine | Biogas | Generator |
| 4 | Corrugated iron | Corrugated iron | Earth | Protected well/spring | Bucket | Kerosene | Water mill |
| 5 | Dhani/ <br> Theke/In leaf | Dhani/ <br> Theke/In leaf | Other | Waterfall/ rainwater | Other | Charcoal | Battery |
| 6 | Earth | Other |  | Tanker/truck | No toilet | Coal | Candle |
| 7 | Other |  |  | River/stream/canal/unprotected well/spring/pool/pond/lake |  | Firewood/ straw/grass | Kerosene |
| 8 |  |  |  | Other |  | Other | Other |

The responses to the Census questions for these variables were then assigned scores that were consolidated for every household. Since there are seven housing quality variables, the best/top consolidated score (representing the minimum score of 1 for each item) would be 7 (that is, $1+1+1+1+1+1+1$ ) per household, while the maximum possible score $(7+6+5+8+6+8+8)$ would be 48 per household. The consolidated scores were then aggregated and ranked as follows:

| Ranking | Consolidated score |
| :--- | :--- |
| 1 | $7-14$ |
| 2 | $15-22$ |
| 3 | $23-30$ |
| 4 | $31-38$ |
| 5 | $39-48$ |

## Chapter 7. Housing adequacy and quality

### 7.2 Housing quality dynamics

Adopting the ranking order shown in Table 7.1, the results of the 2014 Census shown at Figure 7.1 indicate that, at the Union level, the quality of housing for most households in Myanmar ( 4.6 million, 42.3 per cent) is ranked 3 , where rank 1 denotes the highest comparative level of quality and rank 5 the lowest. However, households ranked 4 and 5 are consolidated for all analyses in this section, in the light of the relatively small number ranked 5 (just 172 thousand - see Appendix 1, Table A12). However, the numbers and percentages are presented for rank 4 and rank 5 separately in all the related Appendix Tables.

Figure 7.1 shows that the quality of housing in urban areas was significantly higher than in rural areas: proportionately, thirteen times more urban households ( 32.3 per cent) were living in dwellings ranked 1 than rural households (2.5 per cent).

The overall profile at the Union level of housing quality (in which households living in rank 3 housing comprised the largest proportion) is mirrored in all States/Regions except Yangon and Rakhine. The predominance of highest quality housing is particularly evident in Yangon, where 37.1 per cent of households were living in dwellings ranked 1, while less than 1 per cent of households were living in such dwellings in Rakhine and Chin. Conversely, Rakhine had the highest percentage ( 68.4 per cent) of households living in the lowest quality housing (rank $4 / 5$ ), while almost half of households in Ayeyawady ( 48.2 per cent) were similarly housed. Appendix 1, Table A12 shows that for some Districts even higher proportions of households were reported in the two lowest ranked categories. In Myauk U (Rakhine) for example, 82.5 per cent of households lived in the poorest quality housing, while Labutta (Ayeyawady) scored highest with households in rank 5 housing (11.6 per cent). At the other end of the spectrum, two of Yangon's Districts (West and East Yangon) had more than half of their households living in rank 1 housing ( 78.0 per cent and 55.5 per cent respectively) while outside of Yangon, Tachileik (a District in eastern Shan that shares a border with Thailand and Lao PDR) had over a third of its households ( 34.9 per cent) living in rank 1 housing.

## Chapter 7. Housing adequacy and quality

Figure 7.1
Percentage of households by housing quality rank, urban and rural areas, State/Region, 2014
Census

### 7.2.1 Housing quality and household size

The quality of the living environment of households, determined largely by the physical attributes of their living premises, may also be affected by the number of people sharing the dwelling facilities such that the higher the number of occupants, the lower the quality of the living environment (all other things being equal). This report therefore reviews the housing quality vis-à-vis the number of occupants.

Figure 7.2 shows that the proportion of households in housing whose quality level is ranked 2 increases (from 16.9 to 29.4 per cent) with the increase in the number of household members from one to nine or more, while the proportions of households in housing ranked $4 / 5$ decreases (from 30.9 per cent to 18.3 per cent). However, there was, strangely, no clear pattern in the proportion of households in the highest quality ranked housing when viewed against the number of occupants; indeed, the proportion was lowest ( 9.5 per cent) among households with six persons but highest (13.5 per cent) among the largest households with nine or more persons. The results from the Census, though seemingly unexpected, are inconclusive, and thus the relationship between household size and housing quality in Myanmar should be further investigated. The numbers and percentages of households by rank and household size are shown for urban and rural areas in Appendix 1, Table A13(a).

## Chapter 7. Housing adequacy and quality

Figure 7.2
Percentage of households by housing quality rank by household size, 2014 Census

### 7.2.2 Housing quality and tenure

The quality of housing was evaluated against the tenure of households. Figure 7.3 shows that at the Union level, the percentage of home ownership is lower in the highest housing quality rank 1 (56.4 per cent) than in any other housing quality ranks. Renting households, although not large, proportionately, are scattered among all the quality categories but are more predominant in ranks 1 and 2 , particularly in rank 1 where the percentage of renters is highest ( 20.4 per cent) than for any other housing quality ranks. Figure 7.3 shows that government provided housing units, though relatively small in number, account for 18 per cent of the highest quality housing (rank 1). Within each housing quality rank, urban areas show higher percentages of renters than corresponding rural areas.

Given that most households own their dwellings in Myanmar, the results did not show any direct influence of tenure on housing quality. This is not surprising since, as has been noted in section 7.1 above, the tenure of a household as recorded in the Census may not directly imply the quality of the dwelling occupied by the household, and the variable was, for this reason, not used in compiling the quality index. However, the preponderance of renters in rank 1 housing might be seen to support the evidence in Chapter 4 in the discussion on wall materials as a proxy for structural adequacy that households who rent their dwellings tend to live in better housing than those who own their dwellings.

## Chapter 7. Housing adequacy and quality

Figure 7.3
Percentage of households by housing quality rank by tenure, urban and rural areas, 2014 Census

As noted above, most households in Myanmar are in the middle housing quality category (rank 3) ( 42.3 per cent). Figure 7.4 shows that the highest housing quality is found among 'Government quarters' where about 3 in 5 housing units ( 59.9 per cent) in this type of tenure are in the highest housing quality rank (rank 1) and less than 1 per cent are in the lowest quality rank (rank 4/5). The poorest housing quality units are found in the 'Other' tenure category, where 36.9 per cent of households are in the lowest quality rank (rank 4/5). The second poorest housing quality units are found among 'Owner' occupied dwellings, where about 28.9 per cent of the housing units are in the poorest rank (rank 4/5), followed by those in the 'Provided free' category ( 22.5 per cent). The pattern observed at the Union level above can also be observed in both urban and rural areas as presented in Appendix 1, Table A13(b).

Figure 7.4
Percentage of households by tenure by housing quality rank, 2014 Census

## Chapter 7. Housing adequacy and quality

### 7.2.3 Housing quality and economic activity of head of household

Housing quality was assessed against the economic activity of heads of households. Figure 7.5 and Appendix 1, Table A13(c) show that government employees have the best quality of housing as evidenced by the fact that 47.1 per cent of heads of households who are government employees lived in housing that is quality rank 1, while less than 1 in 10 household heads who were private company workers (8.9 per cent); own account workers ( 6.9 per cent); contributing family workers ( 4.5 per cent); and seeking work ( 9.2 per cent) lived in rank 1 housing. This may be an indication of lower pay, non-adherence to certain building standards, or poorer working conditions, or all of these factors - particularly for employees of private organizations, own account workers, contributing family workers and those seeking work - which render them less able to afford or gain access to good quality housing.

Figure 7.5
Percentage of households by economic activity of head by housing quality rank, 2014 Census

### 7.2.4 Housing quality and type of dwelling

Though the type of dwelling - whether flat, bungalow or hut - on its own may not exclusively determine the quality of housing, it is, none the less, a good indication of its soundness and quality. It is to be expected, for example, that households occupying flats should have a better housing quality than those living in huts. The results of the Census more or less confirmed this perception given that one in three households that belonged to housing quality rank 1 were living in a condominium/apartment/flat (33 per cent) with a few assessed to be in quality rank 2 (Figure 7.6 and Appendix 1, Table A13(d)). Conversely, a majority of households in rank 4/5 were living in a bamboo type dwelling.

## Chapter 7. Housing adequacy and quality

Figure 7.6
Percentage of households by housing quality rank by type of dwelling, urban and rural areas, 2014 Census

Figure 7.7
Percentage of households by type of dwelling by housing quality rank, 2014 Census

Figure 7.7 shows that the highest quality of housing is found among the 'Condominium/ apartment/flat' category where almost 8 out of 10 households ( 79.7 per cent) living in housing units of this type of dwelling are in the highest housing quality rank (rank 1), and literally none are in the poorest quality rank (rank 4/5). The poorest housing quality units are found among 'Hut 1 year' and 'Hut 2-3 years' dwelling types where 80.0 per cent and 70.7 per cent of households live in housing units that are in the lowest rank (rank 4/5), respectively.

## Chapter 7. Housing adequacy and quality

The second poorest housing quality units are found in the 'Other' dwelling type category, where a little under a half ( 47.7 per cent) of households are in the lowest quality rank (rank 4/5). The pattern observed at the Union level above can also be observed in both urban and rural areas (Appendix 1, Table A13(d)).

### 7.3 Homelessness/persons in other collective quarters

There is no universally acknowledged definition of 'homelessness' (FEANTSA, 2011) and, as a result, the condition has been variously defined within different contexts. For some purposes it can be defined narrowly to include only people without a roof over their heads, or in other cases it can be defined more broadly. However, homelessness is a global problem. In 2005, the United Nations estimated that 100 million people were homeless worldwide and as many as 1 billion people lacked adequate housing ${ }^{7}$.

Basically, 'homelessness' refers to a temporary (or sometimes not so temporary) condition where people are deprived of access to a home and, as a result, have resorted to living in a place not meant for human habitation, such as an emergency shelter, in transitional housing, on the streets, in abandoned buildings or vehicles, etc. This situation may occur when people cannot afford to pay for a place to live; are fleeing or attempting to flee domestic violence; suffer mental illness; or when their current home is unsafe or unstable. There are, thus, both social and economic triggers to homelessness.

More generally a homeless person can be considered as "an individual who lacks housing (without regard to whether the individual is a member of a family), including an individual whose temporary residence during the night is a supervised public or private facility (such as shelters) that provides temporary living accommodation, and an individual who is a resident in transitional housing." (US Department of Health and Human Services, 2011). A homeless person is an individual without permanent housing who may live on the streets, in a shelter, in an abandoned building or vehicle, or in any other unstable or non-permanent situation. However, as this report is using Census-based data it should be noted that, for census purposes, the United Nations (2008) attempts to define homelessness by distinguishing 'primary homelessness' (often referred to as the 'roofless', or persons sleeping rough) from 'secondary homelessness' (those who have no regular place of usual residence, otherwise referred to as the 'rootless'). However the Myanmar Census made no attempt to distinguish between these two types of homelessness.

However defined, 'homelessness' is the most extreme state of housing deprivation. The 2014 Census reported that almost one million persons were recorded as homeless or as persons in other collective quarters. This represents almost 2 per cent of the enumerated population (Table 7.2).

[^5]
## Chapter 7. Housing adequacy and quality

## Table 7.2

Number and percentage of 'homeless' persons or persons in other collective quarters, State/Region, 2014 Census

| State/Region | Population | Number of homeless persons/ <br> persons in other collective quarters | Percentage of homeless persons/ <br> population in other collective quarters |
| :--- | ---: | ---: | ---: |
| UNION | $\mathbf{5 0 , 2 7 9 , 9 0 0}$ | $\mathbf{9 7 3 , 5 7 7}$ | $\mathbf{1 . 9 4}$ |
| Kachin | $1,642,841$ | 216,457 | 13.18 |
| Kayah | 286,627 | 5,179 | 1.81 |
| Kayin | $1,504,326$ | 15,965 | 1.06 |
| Chin | 478,801 | 3,586 | 0.75 |
| Sagaing | $5,325,347$ | 119,997 | 2.25 |
| Tanintharyi | $1,408,401$ | 20,232 | 1.44 |
| Bago | $4,867,373$ | 24,282 | 0.50 |
| Magway | $3,917,055$ | 51,372 | 1.31 |
| Mandalay | $6,165,723$ | 104,723 | 1.70 |
| Mon | $2,054,393$ | 39,119 | 1.90 |
| Rakhine | $2,098,807$ | 20,897 | 1.00 |
| Yangon | $7,360,703$ | 158,664 | 111,785 |
| Shan | $5,824,432$ | 35,942 | 45,377 |
| Ayeyawady | $6,184,829$ | $1,160,242$ |  |
| Nay Pyi Taw |  |  | 2.16 |

Comparing the prevalence of homelessness/persons in others collective quarters across the States/Regions, Kachin recorded the highest proportion of homeless persons/persons in other collective quarters at 13.2 per cent, while Bago at 0.5 per cent recorded the lowest. It is however, not easily interpretable from other Census data why Kachin should have reported such a high proportion of homeless persons or those living in other collective quarters. This may need to be investigated further to determine the reasons behind this outlying figure.

The data shown at Table 7.2 should, however, be treated with some caution given, not only the definitional concepts, but also the challenges experienced in collecting good quality data about this hard-to-count population group. In the 2014 Census special enumerators were employed to record, on the Institution questionnaire, the details of people found sleeping in the open on Census Night, but this only would have been a subset of the 'roofless' since families living in make-shift shelters were enumerated as households by the Main questionnaire and were thus not counted as homeless. The formal homeless were grouped together on the Institution questionnaire with people found living in 'other collective quarters' and who would not otherwise be regarded as 'roofless' - though they may have been 'rootless'. Thus the count of the homeless given here will include elements of both an under and over count.

### 7.4 Housing requirements

From the results presented in Chapter 3, the number of households in Myanmar grew from $6,495,621$ in 1983 to $10,877,832$ in 2014 . This growth is expected to continue into the future. Given the expected norm that each household should ideally occupy a house/dwelling unit, any such growth requires a commensurate growth in housing. If the growth of households is not matched by an equivalent growth in new housing, as is the case in most less developed

## Chapter 7. Housing adequacy and quality

countries, then households usually resort to extraordinary methods including occupying make-shift and substandard dwellings.

While there is agreement on the need for an assessment of housing needs, no equivalent consensus on the approach and methodology for assessing this need exits in a given jurisdiction. However, the following methodology propagated by Struyk et al (1990) has been one of the pillars for international housing needs assessments. The approach has evolved from its earlier development, and different variations have been applied by many professionals globally.

The variations in Struyk's approach have mainly been informed by the different structures of the housing market in various countries and the nature of housing data available for undertaking the assessment. From the various attempts to derive housing requirements and from the data collected from the 2014 Census, the following are some of the variables that constitute housing requirement:

- Unmet current housing need
- Homelessness
- Households with deficient physical attributes to an extent that their shelter is irreparable
- Households without adequate/exclusive access to basic services such as a toilet, safe water, human waste disposal, etc.
- Newly arising housing needs.

If the current unmet needs $=A$, the number of homeless $=B$, the extent of deficient housing (in terms of both structure and access to services) $=C$, and any newly arising need $=D$, then the Housing Requirement $=A+D,($ where $A=B+C)$.

The following analysis focuses on the first component of the housing requirement formula - the current unmet housing need (A). Therefore for the purpose of this report, the housing quality ranking presented earlier has been translated into the state of housing to assess the deficiencies as follows:

| Excellent <br> (Rank 1) | Good <br> (Rank 2) | Somewhat deficient and requires <br> some repairs/ modifications <br> (Rank 3) | Deficient <br> (Rank 4) | Extremely deficient <br> (Rank 5) |
| :---: | ---: | ---: | ---: | ---: |
| $1,181,079$ | $2,239,569$ | $4,602,285$ | $2,682,685$ | 172,214 |

The calculation is then done at the Union level as follows. From the information recorded in the Census, the number of homeless persons/persons in other collective quarters is 973,577 (Table 7.2), and the number of households whose housing is deemed to be deficient or extremely deficient is $2,854,899$. Rounding to the nearest thousand for estimation purposes, the current unmet need (A) is, therefore the number of homeless/persons in other collective quarters $(974,000)+$ the number of households whose housing is extremely or minimally deficient $(2,855,000)=3,828,000$, representing the total number of 'units' (households and homeless persons/persons living in other collective quarters) who require housing.

## Chapter 8. Conclusion and recommendations

### 8.1 Conclusion

This thematic report has been prepared at a very critical moment in the history of Myanmar and at the global level. Myanmar is undergoing a transition after successful elections in 2015, while the world has recently welcomed the 2030 Agenda for Sustainable Development and the New Urban Agenda after Habitat III was held in Quito, Ecuador in October 2016.

The findings of this report have far-reaching consequences in the sustainable development agenda for Myanmar. The results presented will, at the same time, enable Myanmar to assess its progress in fulfilling national and international development goals.

Key among the results are:

- The average household size was 4.4, which was a noticeable decline from the average of about five during the period 1983 to 2001. Myanmar's average household size is slightly higher than that of most neighbouring countries, except the Philippines.
- About one in four households (23.7 per cent) were female-headed, with this proportion being higher in urban areas (27.7 per cent) than in rural areas (22.2 per cent).
- Some 85.5 per cent of households in Myanmar were owners of the housing units they live in, with this proportion being slightly higher among female-headed households (87.3 per cent) than male-headed households ( 85.0 per cent), and higher in rural areas ( 93.1 per cent) than in urban areas ( 66.0 per cent).
- Most households in the country (81.4 per cent) used traditional and unsustainable energy sources, particularly firewood, for cooking while only 16.8 per cent used modern and sustainable energy sources.
- Slightly more than two out of five households (41.1 per cent) used modern and sustainable sources of energy for lighting, with the proportion being much higher in urban areas ( 78.9 per cent) than in rural areas (26.4 per cent).
- More than two-thirds of households (69.5 per cent) have access to improved drinking water sources in the country, with the proportion being higher in urban areas (86.7 per cent) than in rural areas ( 62.7 per cent).
- About three quarters ( 74.3 per cent) of households had access to improved sanitation, with the proportion again being higher in urban areas ( 92.3 per cent) than in rural areas (67.3 per cent).
- Almost half of all households in Myanmar had access to a television (49.5 per cent), followed by a radio ( 35.5 per cent) and mobile phone ( 32.9 per cent). The least accessible ICT assets were access to the internet ( 6.2 per cent) and access to computers (3.5 per cent).
- A housing quality index showed that households living in housing ranked level 3 (out of 5 bands) comprised the largest proportion ( 42.3 per cent). Only 10.9 per cent of households lived in the highest ranked level 1. However, urban and rural differences were large: 32.3 per cent of urban households and 2.5 per cent of rural households lived in the highest housing quality rank 1.
- Based on an estimate of the number of homeless people/persons living in other collective quarters, and the number of households living in deficient and extremely deficient living conditions, a core housing need of 3.8 million units was estimated for the country.

Chapter 8. Conclusion and recommendations

There is an urgent need to address the immediate housing requirements of those that are the most deprived of decent living conditions. Also, there is a similarly urgent need to conduct a comprehensive national housing survey in Myanmar to provide more depth to the Census findings. In the long-term, future censuses should: attempt to improve coverage of the core United Nations recommended topics; and improve the housing sector monitoring framework through the strengthening of administrative processes and the generation of housing information and records for such purposes as building plan approval records, land registry, stamp duty administration, and mortgage processing - to name just a few. Nevertheless, the 2014 Census results provide a good foundation for improvement of future censuses, monitoring of the housing sector and the tracking of national and international policy goals in Myanmar.

### 8.2 Recommendations

For a country such as Myanmar which has not conducted a comprehensive housing survey in the past, the Census data remains the key source of housing information for policy development and the establishment of national norms and standards. To achieve these, there may be a need to strengthen the housing component of the census questionnaire to include more of the key topics recommended by the United Nations in future censuses. It should be appreciated that while a lengthy questionnaire may be difficult to administer and the resulting increase in information collected more costly to process, there is room for restructuring the housing component of the questionnaire without overburdening it.

There are some recommended questions, which although covered, were structured in a way that was limiting when analyzing the results. For example, the options for the wall, roofing and floor materials were grouped together. It is recommended that it would be better in future censuses to separate the options in the census question, though it is recognized that this may require more space on the questionnaire. Furthermore, there could also be an attempt to disaggregate data on building materials in order to capture information on the level of application of appropriate building materials, and renewable energy use in housing delivery processes. More importantly, however, emphasis should be given to the inclusion of the key United Nations core housing topics of floor space or number of rooms, and shared occupation.

Although an attempt has been made to give an estimation of the core housing needs from the Census data, it would be useful if this is revisited in time in a more comprehensive manner to give a more accurate estimation of housing needs over a determined period.

Given the current lack of housing data, there may be a need to conduct a comprehensive housing survey in the next three years to be concluded by the mid-intercensal period (around 2019), or, alternatively, it may be more cost effective to pilot an expanded set of housing questions in a mid-term intercensal survey.

The following recommendations on national housing policy issues are proposed from the analysis of the 2014 Census data.

## Chapter 8. Conclusion and recommendations

## 1. Building materials

The Census reported that 51.9 per cent of households lived in housing units whose walls were made of semi-permanent materials, while 37.5 per cent had walls made of permanent materials. This result means that there is a need for specific interventions pertaining to maintenance and repair to facilitate the preservation of the national housing stock.

## 2. Maintenance and repairs

Given the prevalence of the use of indigenous construction materials (such as wood and bamboo) for housing in Myanmar, there is a need for a mechanism and standards for maintenance especially for 'responsive repairs ${ }^{8}$ ' to ensure that the existing housing identified in the Census does not deteriorate.

## 3. Improving indoor air quality

Analysis of sources of energy for lighting and cooking is a critical component of the 2030 Agenda for Sustainable Development. Sustainable Development Goal 7 aims at: "Ensuring access to affordable, reliable, sustainable and modern energy for all."

The 2014 Census results revealed that, at the Union level, while as many as 81.4 per cent of households use traditional and unsustainable energy sources, particularly firewood, for cooking, only 16.8 per cent use modern and sustainable energy sources. In enclosed environments, this has serious implications on the indoor air quality. Most people spend a substantial amount of their time indoors. Young children, older people and people with health problems - those who are most susceptible to the effects of poor indoor air - are likely to spend even more time inside. Energy sources used for cooking and lighting have a direct effect on indoor air quality in housing.

There is, therefore, a need for the promotion of modern and sustainable energy sources for cooking, and an immediate intervention to improve housing designs to accommodate the safe use of firewood for cooking. In the medium and long term, there should be incentives to encourage the wider use of cleaner cooking fuels such as solar power, liquefied petroleum gas and electricity.

## 4. Improving the quality of poor housing

Using the responses to the 2014 Census, an attempt was made to develop a consolidated housing quality index to establish the overall quality of the living environment guided by the Habitat Agenda approach to adequate housing.

From the quality index, 26.2 per cent of housing (equivalent to 2,855,000 households) whose housing quality ranked 4 and 5 were regarded as living in deficient and extremely deficient living conditions. These households together with an estimated 974,000 homeless persons/persons living in other collective quarters gives a total of $3,828,000$ persons and households living in poor living conditions who require immediate intervention. There is therefore an urgent need to address housing challenges through a holistic improvement of all the elements of adequate housing.

[^6]
## Chapter 8. Conclusion and recommendations

## 5. Improving home ownership among younger household heads

Home ownership, though a desirable aspiration of most households, tends to be an uphill road for younger household heads due to the lack of sufficient financial resources necessary for attaining home ownership. This fact was confirmed from the results of the Census which revealed that while 14.6 per cent of household heads in the age group 25-34 owned their dwellings, there was a significantly larger proportion of heads aged 45-54 (24.2 per cent) that did so. Conversely, the proportion of younger heads that rented ( 27.4 per cent) was higher than the proportion renting among older heads (20.4 per cent).

This scenario requires the initiation of deliberate interventions to improve the level of home ownership among younger household heads through, for example, improvements in socioeconomic conditions and better access to loans/mortgages.

## 6. Improving access to decent and safe sanitation

Safe and hygienic sanitation is a key ingredient to healthy living environments. The 2014 Census revealed that at the Union level, three quarters ( 74.3 per cent) of households had access to improved sanitation while a quarter ( 25.7 per cent) did not ${ }^{9}$. This result means that there is a need for continued efforts, targeting areas of greater disadvantage, to promote and facilitate the adoption of decent and adequate human waste disposal modes, including cesspools and improved pit latrines, to reduce the quarter of households that do not have access to improved sanitation.

## 7. Improving access to improved drinking water sources

The Census reported that 69.5 per cent of households at the Union level had access to improved drinking water sources while 30.5 per cent did not. While this may signify some progress, there is still much to be done to improve the proportion of households with access to improved drinking water sources to meet Target 6.1 of SDG 6 to achieve universal and equitable access to safe and affordable drinking water for all by 2030, particularly in parts of the country which have the lowest access.

## 8. Standards on minimum size of dwelling units

It emerges that the average household size in Myanmar at the time of the Census was 4.4 and that, furthermore, couples living with children only (41.4 per cent) and couples living with children and other relatives only ( 17.2 per cent) together form the greatest proportion (a total of 58.6 per cent) of households in Myanmar. This means that for the majority of households, given their size and composition, there is a need for minimum size standards that accommodate the family structure, promotes privacy and dignity. As a result conventional households should, as a basic minimum, have two bedrooms, one for the parents and one for the children.

## Glossary of terms and definitions

## Affordable housing: is housing that is appropriate for the needs of a range of low to moderate

 income households and priced such that low and moderate income households are able to meet their other essential basic living costs.Conventional household: includes one or more persons who are either related or unrelated and share living quarters (single quarter or compound) and meals. The household members would usually eat food prepared from the same cooking pot. In most cases, there would be one person acknowledged by the household members as the head of the household.

Data quality assessment: is the scientific and statistical evaluation of data to determine if those obtained from a source such as a census or survey are of the right type, quality, and quantity to support their intended use.

Dwelling (or Housing unit): is a separate and independent place of abode intended for habitation by a single household, or one not intended for habitation but occupied as living quarters by a household at the time of the 2014 Census.

Habitat Agenda: the outcome of the Second United Nations Conference on Human Settlements which was held in Istanbul, Turkey from June 3-14, 1996.

Head of (conventional) household: is the household member who makes key decisions and is recognized as the head of the household by others. The head of household may be male or female. The person is not necessarily mainly responsible for earning the livelihood for the household. In the 2014 Census, if the head of household was not present on Census Night, the next most responsible member was reported as the de facto head.

Headship rate: the ratio of the number of household heads to the size of the adult population (aged 15 and over). Age-specific headship rate is the proportion of people in any specific age group (aged 15 and over) who are household heads.

Household formation: is the rate at which new households are forming within a given span of time.

Household size: is the number of people enumerated in a conventional household. Average household size is the ratio of the total number of people in conventional households to the number of such households.

Housing: is a multi-dimensional product that includes physical shelter; socioeconomic and cultural dynamics; related services and infrastructure; and the inputs required to produce and maintain it. It also includes the processes and outcomes of the production and use of residential dwellings.

Housing quality: is a comprehensive concept that outlines whether or not housing is sufficient to meet recognized housing quality standards as well as specific household needs. It takes into account, among other characteristics, type of construction, materials used, amount of space, services and facilities, condition of facilities within and outside the dwelling, function and aesthetics.

## Housing unit: See Dwelling.

Improved drinking water: is drinking water from a source that is defined as one that, by nature of its construction or through active intervention, is likely to be protected from outside contamination, in particular from contamination with faecal matter. The 2014 Census identified the following sources as 'Improved': Tap/piped water; Tube well/borehole; Protected well/spring; and Bottled/purified water. All other sources of drinking water identified in the Census were classified as 'Unimproved'.

Improved sanitation: is a toilet facility that hygienically separates human excreta from human contact. The 2014 Census identified the following toilet facilities as 'Improved': Flush, and Water seal (improved latrine). All other types of toilet identified in the 2014 Census were classified as 'Unimproved'.

Institutional population: is a unit where a group of people are living together other than in a conventional household. Examples include: old people’s homes; orphanages; hospitals; boarding schools; hotels, hostels and guest houses; institutions for persons with disabilities; prisons; monasteries; convents; military and police barracks; and camps for workers.

Rural area: is an area classified by the Department of General Administration (GAD) as a village tract. Generally, such areas have a low population density and a land use which is predominantly agricultural.

Tenure: describes the status of the arrangements under which households occupy their accommodation, which may comprise all or part of a dwelling. Such status of tenure does not necessarily require the existence of legal documentation to establish the right to such occupation but rather defines the clarity and predictability of the terms of occupation. The 2014 Census identified five categories of tenure: Owner; Renter; Provided free; Government quarters; Private company quarters; and Other.

Urban area: is an area classified by the General Administration Department (GAD) as a ward. Generally such areas have an increased density of building structures, population and better infrastructural development.

## List of Contributors

Contributors to the Housing Conditions and Household Amenities thematic report

| Name | Institution | Role |
| :---: | :---: | :---: |
| Government Coordination |  |  |
| U Myint Kyaing | Permanent Secretary, Ministry of Labour, Immigration and Population | Overall administration and coordination |
| U Nyi Nyi | Deputy Director General, Department of Population (DoP) | Administration, coordination and quality control |
| Daw Khaing Khaing Soe | Director, DoP | Administration, coordination and quality control |
| UNFPA Coordination |  |  |
| Janet E. Jackson | Country Representative | Overall administration and coordination |
| Fredrick Okwayo | Chief Technical Advisor (former) | Overall design, administration,coordination and quality assurance |
| Mercedita Tia | Chief Technical Advisor | Administration, coordination and quality assurance |
| Daniel Msonda | Programme Specialist, Census | Administration and coordination |
| Thet Thet U | Programme Assistant | Administration and logistics |
| Thida Aye Maung | Programme Assistant | Administration and logistics |
| Tun Tun Win | Project Assistant | Administration and logistics |
| Authors |  |  |
| Thomas Onyango Ogutu | UNFPA Consultant | Lead Author |
| Daw Sandar Myint | Deputy Director, DoP | Assisting Author |
| Daw May Myint Bo | Staff Officer, DoP | Trainee and Assisting Author |
| Daw Khin Thu Han | Assistant Immigration Officer, DoP | Trainee and Assisting Author |
| Daw Su Myat Oo | Immigration Assistant, DoP | Trainee and Assisting Author |
| Daw Aye Thiri Zaw | Junior Clerk, DoP | Trainee and Assisting Author |
| Reviewers and Editors |  |  |
| UN Habitat |  | Peer Review |
| Piason Mlambo | UNFPA, Zimbabwe | Peer Review |
| Esther Bayliss | UNFPA Consultant | Editing, review and proofreading |
| Ian Stuart White | UNFPA Consultant | Editing and review |
| Daniel Msonda | Programme Specialist, Census | Proof reading, editing and review |
| Kyung Ae Park | UNFPA Consultant | Review and quality assurance |
| U Nyi Nyi | Deputy Director General, DoP | Proof reading, editing and review |
| Daw Khaing Khaing Soe | Director, DoP | Proof reading, editing and review |
| Data Processing and IT Team |  |  |
| Arij Dekker | UNFPA Data Processing Consultant | Data editing and programming |
| Daw Khaing Khaing Soe | Director, DoP | Programming and generation of tables |
| Daw Sandar Myint | Deputy Director, DoP | Programming and generation of tables |
| Daw May Myint Bo | Staff Officer, DoP | Generation of tables |
| Daw Lin Lin Mar | Staff Officer, DoP | Generation of maps |
| Daw Khin Thu Han | Assistant Immigration Officer, DoP | Generation of tables |
| Daw Su Myat Oo | Immigration Assistant, DoP | Generation of tables |
| U Thant Zin Oo | Assistant Computer Operator, DoP | Generation of maps |
| Daw Aye Thiri Zaw | Junior Clerk, DoP | Generation of tables |
| U Wai Phyo Win | UNFPA Census IT Manager | Information technology services |
| Designer |  |  |
| Karlien Truyens | UNFPA Consultant | Graphic Designer |

[^0]:    ${ }^{1}$ The Habitat Agenda is the outcome of the Second United Nations Conference on Human Settlements (Habitat II) which was held in Istanbul, Turkey from June 3-14, 1996. It encompassed the Istanbul Declaration and the Global Plan of Action on Shelter and Human Settlements, and is the blueprint framework that has been guiding housing and human settlements policies, globally, for the last 20 years. The Habitat Agenda is premised on two themes: adequate shelter for all and sustainable human settlements development in an urbanizing world. The Habitat Agenda was replaced by the New Urban Agenda at the world meeting in Quito, Ecuador, in October 2016.

[^1]:    ${ }^{2}$ It is important to note that this was only applicable to the extent of convergence of coverage.

[^2]:    ${ }^{3}$ A family nucleus is one of the following types (each of which much consist of persons living in the same household): (a) A married couple without children; (b) A married couple with one or more unmarried children; (c) A father with one or more unmarried children; and (d) A mother with one or more unmarried children.
    ${ }^{4}$ The term 'Couple' in this thematic report is strictly interpreted to mean the head of household and his/her spouse (husband/wife). The two categories 'head' and 'spouse' were assigned codes 1 and 2 respectively in the 2014 Myanmar Census question on relationship.

[^3]:    ${ }^{5}$ It is important to interpret these figures on access to sanitation with the understanding that according to international standards as monitored and presented by WHO/UNICEF JMP, when a household has access to an improved facility but are sharing this with another household, it impacts negatively on the overall assessment of their access to improved sanitation. The 2014 Census did not collect information on toilet sharing and therefore a proportion of households with access to improved sanitation may well be sharing.

[^4]:    ${ }^{6}$ In categorizing mobile phones in category 2 instead of category 1 , it is appreciated that smart phones are currently enabling more people to access the internet than many other appliances. However, the 2014 Census questionnaire did not separate smart phones from other mobile phones.

[^5]:    ${ }^{7}$ See https://www.homelessworldcup.org/homelessness-statistics/\#africa

[^6]:    ${ }^{8}$ A term used to describe day-to-day repairs that cannot be planned or included in a longer-term investment programme. It covers repairs needed to fix a single defect that can be carried out within 20 working days.

[^7]:    ${ }^{9}$ It is important to interpret these figures on access to sanitation with the understanding that, according to international standards as monitored and presented by WHO/UNICEF JMP, when a household has access to an improved facility but is sharing with another household, this impacts negatively on the overall assessment of its access to improved sanitation. The 2014 Census did not collect information on toilet sharing and therefore a proportion of households with access to improved sanitation may well be sharing.
