## Foreword

The 2014 Myanmar Population and Housing Census (2014 Census) was conducted with midnight of 29 March 2014 as the reference point. This is the first Census in 30 years; the last was conducted in 1983. Planning and execution of this Census was spearheaded by the former Ministry of Immigration and Population, now the Ministry of Labour, Immigration and Population, on behalf of the Government, in accordance with the Population and Housing Census Law, 2013. The main objectives of the 2014 Census are to provide the Government and other stakeholders with essential information on the population, in regard to demographic, social and economic characteristics, and housing conditions and household amenities. By generating such information at all administrative levels, it is also intended to provide a sound basis for evidence-based decision-making, and to evaluate the impact of social and economic policies and programmes in the country.

The results of the 2014 Census have been published so far in a number of volumes. The first was the Provisional Results (Census Volume 1), released in August 2014. The Census Main Results were launched in May 2015. These included The Union Report (Census Report Volume 2), Highlights of the Main Results (Census Report Volume 2-A), and the reports for each of the 15 States and Regions (Census Report Volume 3[A-O]). The reports on Occupation and Industry (Census Report Volume 2-B), and Religion (Census Report Volume 2-C) were launched in March 2016 and July 2016, respectively.

The current set of the 2014 Census publications comprises 13 thematic reports and a Census Atlas. They address issues on Fertility and Nuptiality; Mortality; Maternal Mortality; Migration and Urbanization; Population Projections; Population Dynamics; the Older Population; Children and Youth; Education; Labour Force; Disability; Gender Dimensions; and Housing Conditions and Household Amenities. Their preparation involved collaborative efforts with both local and international experts as well as various Government Ministries, Departments and research institutions. The thematic reports published to date include: Fertility and Nuptiality; Mortality; Maternal Mortality; Migration and Urbanization; Population Dynamics; Population Projections; the Labour Force; Education; Housing Conditions and Household Amenities; Gender Dimensions; Disability; and the Older Population.

Data capture for the Census was undertaken using scanning technology. The processes were highly integrated, with tight controls to guarantee accuracy of results. To achieve internal consistency and minimize errors, rigorous data editing, cleaning and validation were carried out to facilitate further analysis of the results. The information presented in these reports is therefore based on more cleaned data sets, and the reader should be aware that there may be some small differences from the results published in the earlier set of volumes.

The children and youth in Myanmar today represent the future of our country. This report draws on the information collected in the Census to present a picture of the younger generation in order to assess how well children are being given a good start in life through better health, a nurturing home life, and improved educational opportunities, and how youth are transitioning to adulthood in ways that will contribute to the country's social and economic development.

The total number of children and youth rose from 16.9 million in 1973 to 23.4 million in 2014. Assuming continued fertility decline and improvements in child mortality, it is anticipated
that over the next ten years the number of children and youth will increase very little, and that in the following two decades the numbers will even decline from 24.5 million in 2024 to 23.1 million by 2044.

With still close to half of the population comprising children and youth, the country should benefit from the "demographic dividend" through savings and investments for the modernization of agriculture and the development of manufacturing sectors, where most 15 to 29 year olds are working.

One in three children live in households which use kerosene or candles as the main source of energy for lighting, while a significant proportion live in households which use solid fuels or kerosene for cooking. These could put children at risk of respiratory diseases, poisoning and fire. More than two thirds of rural children and one fifth of urban children live in households with two or more of these health risks.

Eight per cent of children aged 10-13 in Myanmar are engaged in child labour. The Government of Myanmar is committed to reduce, if not eliminate, child labour. This commitment was stipulated in the 1993 Child Law which was amended in 2014, and states that children under the age of 12 should not work and those between the ages of 12 to 14 should only take on light work which will not interfere with their education, health or development.

Attending and completing at least some primary school grades has become an almost universal experience for children in Myanmar. However, not all children complete primary school, and even fewer pursue secondary school. Education reform is needed to reduce obstacles and increase the benefits of schooling to encourage children and families to complete higher education.

The results presented in this report show the need to invest in a healthy foundation for children, especially in rural areas, by improving access to safe water and sanitation, better availability of electricity and affordable health care. There is also a need to invest in meaningful and accessible education by reducing the obstacles which children face in attending school beyond primary level.

On behalf of the Government of Myanmar, I wish to thank the teams at the Department of Population, the United Nations Population Fund (UNFPA) and the authors for their contribution towards the preparation of this thematic report. I would also like to thank our development partners, namely: Australia, Finland, Germany, Italy, Norway, Sweden, Switzerland, and the United Kingdom for their support to undertake the Census, as well as the technical support provided by the United States of America.

## Table of Contents

## Foreword / II

List of Tables / VIII
List of Figures / XI
List of Boxes / XIII
List of Tables in Appendices / XIV

## List of Acronyms / XVI

## Executive Summary / XVII

## 1. Introduction /

1.1 Background / 1
1.1.1 Children, youth and development / 1
1.1.2 Defining a child and youth / 2
1.2 Objectives of the report / 3
1.3 Data quality and limitations / 3
1.4 Overview of the report / 5
2. Demographic characteristics of children and youth / 6
2.1 Population size and geographic distribution / 6
2.2 Population growth / 9
2.3 Age and sex composition / 11
2.3.1 Child dependency ratios / 11
2.3.2 The youth bulge / 12
2.3.3 Sex ratio / 14
2.4 Summary / 15

```
3. Housing, infrastructure, services and assets - the hardware for health / 17
3.1 Housing type and tenure / 17
3.2 Infrastructure for health / 22
3.2.1 Cooking fuel / 22
3.2.2 Main source of lighting / 23
3.2.3 Main source of drinking water / 24
3.2.4 Type of toilet / 26
3.2.5 Summary of the healthiness of households / 28
3.3 Connectivity / 31
3.3.1 Transport / 31
3.3.2 Communication assets / 32
3.4 Summary / 34
```

## 4. Living arrangements of children and youth /

4.1 Living arrangements of children in conventional households / 35
4.2 Children in institutions / 39
4.3 Living arrangements of youth / 42
4.3.1 Youth in conventional households / 43
4.3.2 Youth in institutions / 44
4.3.3 Youth living independently / 46
4.4 Wealth status of households in which children and youth live / 47
4.5 Summary / 50
5. Health: mortality and disability / 5
5.1 Mortality of young children / 52
5.1.1 Mortality of infants and children under five / 52
5.1.2 Factors influencing infant and child mortality / 55
5.2 Mortality of older children and youth / 58
5.3 Children and youth with disabilities / 60
5.3.1 Prevalence of disability / 61
5.3.2 Geographic distribution of children and youth with disabilities / 64
5.3.3 Children with a disability in institutions / 65
5.3.4 Childhood disability and poverty / 66
5.3.5 Disability and transitions into adulthood / 66
5.4 Summary / 69

## 6. Children at school and work / 71

6.1 Starting school, staying in school and completing school / 71
6.1.1 Measuring schooling / 72
6.1.2 Children currently attending school / 73
6.1.3 Children's educational attainment / 74
6.1.4 Factors influencing children's educational attainment / 76
6.2 Children and work / 77
6.2.1 Labour force participation rates / 78
6.2.2 Occupation and industry / 83
6.3 Combining school and labour / 85
6.4 Summary / 87

## 7. Transition from school to work for youth / 89

7.1 Youth and literacy / 89
7.2 Educational attainment of youth / 90
7.2.1 Basic education / 90
7.2.2 Higher education / 92
7.3 Participation of youth in the labour force / 93
7.3.1 Labour force participation rates / 93
7.3.2 Starting work / 95
7.3.3 Youth unemployment / 97
7.3.4 Type of youth employment / 100
7.4 Returns from education / 103
7.4.1 Main economic activities and educational attainment / 104
7.4.2 Occupation, industry and educational attainment / 105
7.5 Young women's work / 111
7.6 Summary / 112
8. Starting a family / 113
8.1 Marriage / 113
8.1.1 Census recording of marital status / 113
8.1.2 Proportions marrying or remaining single / 114
8.1.3 Early marriage / 117
8.1.4 Average age at marriage / 120
8.1.5 Characteristics of the young married / 121
8.2 Teenage fertility / 124
8.3 Managing marriage, children and work for young women / 125
8.4 Summary / 127
9. Youth on the move / 128
9.1 Introduction / 128
9.1.1 Youth migration, national development and policies / 128
9.1.2 Concepts and definitions for internal migration / 128
9.1.3 Concepts and definitions for international outmigration / 130
9.2 Internal migration of youth / 130
9.2.1 Lifetime migration / 130
9.2.2 Recent migration / 138
9.3 International migration of youth / 140
9.4 Summary / 145
10. Conclusions and recommendations ..... 147
10.1 Transitions to adulthood / 147
10.2 The state of children and youth / 147
10.3 Recommendations / 14810.3.1 Recommendations for the next census / 148
10.3.2 Recommendations for policy / 148

## List of Tables

2.1 Distribution of children and youth ranked by State/Region, 2014 Census / 7
2.2 Past and projected number of children and youth by sex, 1973-2044 / 9
2.3 Child dependency ratio, 1973-2044 / 11
2.4 Sex ratio of children and youth, urban and rural areas, State/Region, 2014 Census / 15
3.1 Percentage of children and youth in conventional households by tenure of dwelling, urban and rural areas, 2014 Census / 18
3.2 Percentage of children and youth in conventional households by type of housing by tenure, urban and rural areas, 2014 Census / 19
3.3 Percentage of children and youth in conventional households by type of housing, by roofing material, urban and rural areas, 2014 Census / 21
3.4 Percentage of children and youth living in conventional households by access to improved sources of drinking water, urban and rural areas, 2014 Census / 25
3.5 Percentage of children and youth in conventional households with access to improved sanitation, urban and rural areas, 2014 Census / 27
3.6 Percentage of households with children aged 0-4 by number of health risks by type of housing, urban and rural areas, 2014 Census / 30
3.7 Percentage of children and youth in households by mode of transport available to household, urban and rural areas, 2014 Census / 32
3.8 Percentage of children and youth living in a household with or without a television or radio, urban and rural areas, 2014 Census / 32
4.1 Estimated number of children aged $0-14$ in conventional households living with a parent, urban and rural areas, 2014 Census / 37
4.2 Estimated percentage of children aged 0-14 in conventional households living with or without a parent, ranked by percentage living with parents, State/Region, 2014 Census / 38
4.3 The ten Districts with the highest and lowest percentages of children 0-14 years in conventional households living with a parent, 2014 Census / 38
4.4 Percentage of children aged 10-14 years in institutions and conventional households by sex by economic activity, urban and rural areas, 2014 Census / 41
4.5 Number of children aged 0-14 living in institutions by sex, and percentage living in institutions, State/Region ranked by share of total population in institution, 2014 Census / 42
4.6 Percentage of households with children/youth by age of children/youth by size of household, urban and rural areas, 2014 Census / 44
4.7 Number and percentage of youth living in institutions by sex by age, urban and rural areas, 2014 Census / 45
4.8 Percentage of youth aged 15-24 living in conventional households and institutions by sex by economic activity status, 2014 Census / 46
4.9 Percentage of youth living independently by sex by age, 2014 Census / 47
4.10 Percentage of children and youth living in a household whose head is literate by age by relationship to the head, 2014 Census / 48
4.11 Percentage distribution of children aged $0-14$ by wealth index quintile, State/Region, 2014 Census / 49
5.1 Mortality rates of infants and children under five, urban and rural areas, State/Region, ranked by level of under-five mortality, 2014 Census / 53
5.2 Infant, child and under-five mortality rates by selected characteristics, 2014 Census / 56
5.3 Probability of dying $\mathrm{q}(\mathrm{x})$ for children and youth aged 5-29 by five-year age group,
urban and rural areas, 2014 Census / 59
5.4 Percentage of children and youth with a disability by sex by age, urban and rural areas, 2014 Census / 62
5.5 Percentage distribution of children and youth with a disability by degree of disability, urban and rural areas, 2014 Census / 63
5.6 Top ten Districts with the highest numbers of children aged 0-14 with a disability, 2014 Census / 64
5.7 Number and percentage of young children aged 0-4 in institutions by sex by degree and domain of disability, 2014 Census / 65
5.8 Percentage of children aged 5-14 in conventional households currently attending school by degree and domain of disability by sex by age, 2014 Census / 67
5.9 Percentage of youth aged 15-24 in conventional households who are literate by degree and domain of disability by sex, urban and rural areas, 2014 Census / 68
5.10 Percentage distribution of children and youth by disability status by economic activity by sex, 2014 Census / 69
5.11 Percentage of youth never married and renounced by disability status by age by sex, 2014 Census / 69
6.1 Current school attendance rates of children by school-age group by sex, urban and rural areas, State/Region, 2014 Census / 74
6.2 Percentage distribution of persons aged $7-19$ by highest grade completed by age, 2014 Census / 75
6.3 Percentage of children/youth by highest grade completed by selected age by sex, urban and rural areas, 2014 Census / 76
6.4 Percentage of children who were working by age group by sex, urban and rural areas, State/Region, 2014 Census / 80
6.5 Percentage of children/youth by type of activity in the labour force (including vulnerable work) by sex by age, urban and rural areas, 2014 Census / 82
6.6 Percentage of employed children aged 10-13 in conventional households by occupation by sex, urban and rural areas, 2014 Census / 84
6.7 Employment rates for children by age by highest level of education, urban and rural areas, 2014 Census / 87
7.1 Literacy rate and number of people illiterate among youth aged 15-24 in conventional households by sex, State/Region, 2014 Census / 90
7.2 Literacy rate for youth aged 15-24 in conventional households by level of education by sex, urban and rural areas, 2014 Census / 92
7.3 Percentage of youth by completion of post-secondary school education by age by sex, 2014 Census / 92
7.4 Completion of higher education among the older youth, urban and rural areas, 2014 Census / 93
7.5 Child and youth labour force participation rates by sex by age, urban and rural areas, 2014 Census / 95
7.6 Labour force participation rates for youth by sex by age, 1983 and 2014 censuses / 95
7.7 Singulate mean age of starting work, urban and rural areas, 2014 Census / 97
7.8 Youth unemployment rates by sex by age, urban and rural areas, 2014 Census / 98
7.9 Percentage of youth aged 20-24 who were unemployed by highest level of educational attainment by sex, urban and rural areas, 2014 Census / 100
7.10 Percentage of youth not employed and not in education or training (NEET) by age by sex and (for females) adjusted for home production, urban and rural areas, 2014 Census / 104
7.11 Percentage of youth aged 20-24 by sex by main activity status by highest level of educational attainment, 2014 Census / 105
7.12 Labour force participation rate for children and youth by sex, and (for females) adjusted rate, by age, urban and rural areas, 2014 Census / 112
8.1 Percentage of females never married by age, urban and rural areas, 2014 Census / 116
8.2 Percentage of children aged 10-17 ever-married by sex, urban and rural areas, State/ Region, 2014 Census / 118
8.3 Percentage of adolescents ever-married by sex by age, urban and rural areas, State/ Region, 2014 Census / 119
8.4 Districts with the highest proportions of females aged 15-19 ever-married, 2014 Census / 120
8.5 Singulate mean age at marriage by sex, urban and rural areas, State/Region, 2014 Census / 121
8.6 Mean ideal age for marriage for 15-24 year olds, 2004 Family and Youth Survey / 121
8.7 Percentage of youth by marital status by relationship to head of household by sex by age, 2014 Census / 122
8.8 Percentage of never married and ever-married youth by sex by age by wealth index quintile, 2014 Census / 123
8.9 Percentage of female youth who are never married, ever-married with and without children by age by main economic activity, urban and rural areas, 2014 Census / 125
8.10 Opinion of youth aged 15-24 regarding married women working outside the home for pay / 126
9.1 Percentage of youth aged 15-24 who were lifetime inter-State/Region migrants by State/Region of birth by State/Region of usual residence, 2014 Census / 133
9.2 Percentage distribution of flow of youth lifetime inter-State/Region migrants between urban and rural areas, 2014 Census / 134
9.3 Percentage distribution of flows of youth lifetime inter-State/Region migrants from urban and rural areas by State/Region of birth, 2014 Census / 134
9.4 Percentage distribution of flows of youth lifetime inter-State/Region migrants to the State/Region of usual residence, 2014 Census / 135
9.5 Percentage of urban- and rural-born youth lifetime inter-State/Region migrants by type of migration flow, and non-migrants, by selected characteristics, 2014 Census / 137
9.6 Percentage of less than one-year and less than five-year migrants aged 10-29 by reason for move by sex and age, 2014 Census / 139
9.7 Former household members living abroad who left Myanmar in 2010-2014 by sex by age at departure, 2014 Census / 141
9.8 Number of Myanmar youth aged 15-24 living abroad and ratio to every 100 usual residents of the same age by State/Region of origin, 2014 Census / 142
9.9 Districts with a ratio of 10 or more youth aged 15-24 living abroad to every 100 usual residents of the same age, 2014 Census / 142

## List of Figures

1 Map of Myanmar by State/Region and District /
1.1 Reported number of children and youth by single year of age, 2014 Census / 5
2.1 Percentage of children and youth aged $0-24$ years in urban and rural areas, State/ Region, ranked by size of urban population, 2014 Census / 7
2.2 Relative size of the population of children and youth aged 0-24 in urban and rural areas, State/Region, 2014 Census / 8
2.3 Past and projected population growth by population group, 1973-2044 / 10
2.4 Average annual change in the number of children and youth between censuses and decennial projections, 1973-2044 / 10
2.5 Child dependency ratio, State/Region, 2014 Census / 11
2.6 Child dependency ratio, urban and rural areas, State/Region, 2014 Census / 12
2.7 Youth as a proportion of the working-age population, urban and rural areas, State/ Region, 2014 Census / 13
2.8 Age structure showing the percentage of children and youth, selected ASEAN countries / 14
3.1 Percentage of children aged 0-14 in conventional households by main type of fuel for cooking, urban and rural areas, 2014 Census / 23
3.2 Percentage of children aged 0-14 in conventional households by main type of energy for lighting, urban and rural areas, 2014 Census / 24
3.3 Percentage of children aged 0-14 in conventional households, by type of improved sources of drinking water, urban and rural areas, 2014 Census / 26
3.4 Percentage of children aged $0-14$ in conventional households by type of toilet accessible to their households, urban and rural areas, 2014 Census / 27
3.5 Percentage of children aged 0-4 in conventional households by exposure to health risks, urban and rural areas, 2014 Census / 28
3.6 Mean number of health risks in households with children aged 0-4, urban and rural areas, State/Region, 2014 Census / 29
3.7 Percentage of households with children aged 0-4 by number of health risks by type of housing, 2014 Census / 30
3.8 Percentage of children and youth living in a household without access to a television or radio, urban and rural areas, 2014 Census / 33
3.9 Percentage of children and youth living in a household with access to a computer and internet, urban and rural areas, 2014 Census / 34
4.1 Percentage of children in conventional households by relationship to the head of household by age group, urban and rural areas, 2014 Census / 36
4.2 Percentage of persons in institutions by age by sex, 2014 Census / 39
4.3 Percentage of youth in conventional households by relationship to the head of household by age, urban and rural areas, 2014 Census / 43
4.4 Percentage distribution of children and youth by wealth index quintile, urban and rural areas, 2014 Census / 49
4.5 Percentage distribution of children by relationship to the head of the household by wealth index quintile, urban and rural areas, 2014 Census / 50
5.1 Infant and under-five mortality rates in selected ASEAN countries / 54
5.2 Mortality rates of young children by sex, 2014 Census / 54
5.3 Early-age mortality, Townships, 2014 Census / 57
5.4 Probability of dying within the five-year interval $(q(x))$, for males and females in conventional households, urban and rural areas, 2014 Census / 59
5.5 Estimated death rates (10m15) for male youth aged 15-24 by State/Region, 2014 Census / 60
5.6 Percentage of children and youth with a disability by sex by domain of disability, 2014 Census / 63
5.7 Percentage of children and youth with a disability, State/Region, 2014 Census / 64
5.8 Percentage of youth in conventional households by disability status by sex by wealth index quintile, urban and rural areas, 2014 Census / 66
6.1 Proportion of children and youth by highest grade completed by age, 2014 Census / 75
6.2 Percentage of 17 year olds by highest level of education completed by wealth index quintile, 2014 Census / 77
6.3 Percentage of children aged 10-13 who were working by sex, urban and rural areas, 2014 Census / 80
6.4 Percentage of children/youth working or seeking work by age, urban and rural areas, 2014 Census / 81
6.5 Percentage of children/youth working by age, State/Region, 2014 Census / 83
6.6 Percentage of employed children aged 12-13 in conventional households by sex by occupation, urban and rural areas, 2014 Census / 85
6.7 Percentage of urban working children/youth aged 10-17 in conventional households by type of industry by sex, 2014 Census / 86
6.8 Percentage of children and youth by age by main economic activity, urban and rural areas, 2014 Census a) Urban b) Rural / 86
7.1 Proportion of youth aged 20-24 by highest grade completed by sex, urban and rural areas, 2014 Census / 91
7.2 Completion of higher education among older adult cohorts, 2014 Census / 93
7.3 Child and youth labour force participation rates by sex by age, 2014 Census / 94
7.4 Percentage of children and youth who were employed by sex by age, 2014 Census / 96
7.5 Percentage of children and youth who were employed by sex by single year of age, urban and rural areas, 2014 Census / 97
7.6 Youth unemployment rate for 15-24 year olds in Myanmar and other ASEAN countries / 99
7.7 Percentage of youth by type of employment by age by sex, urban and rural areas, 2014 Census a) Male Union b) Female Union c) Male Urban d) Female Urban e) Male Rural f) Female Rural / 101
7.8 Percentage of employed youth by occupation by sex by age, urban and rural areas, 2014 Census a) Male Union b) Female Union c) Male Urban d) Female Urban e) Male Rural f) Female Rural / 106
7.9 Percentage of employed youth aged 15-29 by occupation by highest level of educational attainment, urban and rural areas, 2014 Census a) Urban b) Rural / 109
7.10 Percentage of employed youth aged 15-29 by sex by industry, 2014 Census / 110
7.11 Percentage of youth aged 15-29 employed in selected industries by highest grade completed, 2014 Census / 111
8.1 Percentage of population aged 15-49 reported as 'renounced' by sex by age, 2014 Census / 114
8.2 Percentage of population aged $15-49$ by marital status by sex by age, 2014 Census a) Male b) Female / 115
8.3 Percentage of persons never married by selected ages by sex by highest grade completed, 2014 Census / 116
8.4 Adolescent fertility rate (15-19 years), urban and rural areas, State/Region, 2014 Census / 124
8.5 Adolescent fertility rates for Myanmar and other ASEAN countries / 124
9.1 Percentage of lifetime migrants among children and youth by sex by age by type of move, 2014 Census a) Male b) Female / 131
9.2 Percentage of lifetime migrants among youth aged 15-24 by State/Region of birth by type of move, 2014 Census / 132
9.3 Percentage distribution of lifetime inter-State/Region migrants aged 15-24 by State/ Region of residence, 2014 Census / 132
9.4 Percentage of urban- and rural-born youth lifetime migrants by type of migration by wealth index quintile of youth's household, 2014 Census / 136
9.5 Less than one- and less than five-year recent migration rates for youth aged 10-29 by sex by age, 2014 Census / 139
9.6 Number of former household members living abroad who left Myanmar in 2010-2014 by sex by age at departure, 2014 Census / 140
9.7 Percentage of households with and without an international emigrant youth by wealth index, urban and rural areas, 2014 Census / 143
9.8 Percentage of households with and without an international emigrant youth by wealth index quintile, State/Region, 2014 Census / 144

## List of Boxes

5.1 Child Law (2014 Amendments) as it relates to health / 52
6.1 Child Law (includes 2014 Amendments) on education / 71
6.2 Structure of Myanmar's basic education system / 72
6.3 1993 Child law (2014 Amendments) on employment / 79

## List of Tables in Appendices

A2.1 Number and percentage of children and youth aged 0-24 years, urban and rural areas, State/Region, 2014 Census / 166
A2.2 Child dependency ratio and proportion of youth in working-age population, urban and rural, State/Region, 2014 Census / 166
A2.3 Population by sex by age, urban and rural areas, State/Region, 2014 Census / 167
A2.4 Percentage of children and youth in conventional households by type of housing by tenure, urban and rural areas, 2014 Census / 172
A2.5 Percentage of children and youth in conventional households by type of housing, by roofing material, urban and rural areas, 2014 Census / 173
A2.6 Percentage of children and youth in conventional households by age by type of cooking fuel used, urban and rural areas, 2014 Census / 174
A2.7 Percentage of children and youth in conventional households by age by type of lighting, urban and rural areas, 2014 Census / 175
A2.8 Percentage of children and youth in conventional households by age by source of drinking water, urban and rural areas, 2014 Census / 176
A2.9 Percentage of children and youth in conventional households by age by type of toilet, urban and rural areas, 2014 Census / 177
A2.10 Percentage of children aged 0-4 in conventional households living with domestic health risks, urban and rural areas, State/Region, 2014 Census / 178
A2.11 Percentage of children and youth in conventional households by age by mode of transport available to households, urban and rural areas, 2014 Census / 180
A2.12 Percentage of children and youth in conventional households by age by access to ICT devices, urban and rural areas, 2014 Census / 181
A2.13 Percentage of children in conventional households by sex by age by relationship to the head of household, urban and rural areas, 2014 Census / 182
A2.14 Estimated percentages of children aged 0-14 in conventional households living with or without their parents, State/Region and District, 2014 Census / 183
A2.15a Young children aged $0-4$ living in an institution, State/Region and District, 2014 Census / 186
A2.15b Children aged 0-14 living in an institution, State/Region and District, 2014 Census / 188
A2.16 Percentage of youth in conventional households by sex by age by their relationship to head of household, urban and rural areas, 2014 Census / 190
A2.17 Percentage distribution of children and youth by wealth index quintile, State/Region, urban and rural areas, 2014 Census / 192
A2.18 Children and youth with a disability by domain of disability by sex by age, urban and rural areas, 2014 Census / 193
A2.19 Children and youth with a disability, urban and rural areas, State/Region and District, 2014 Census / 195
A2.20 Number of youth by sex by degree of disability by wealth index quintile, urban and rural areas, 2014 Census / 197
A2.21 Percentage of 17 year olds by completed level of education by sex by wealth index quintile, urban and rural areas, 2014 Census / 198
A2.22 Percentage of children/youth aged 10-17 in the labour force by type of activity by age by sex, State/Region, 2014 Census / 200
A2.23 Numbers of children/youth aged 10-17 in the labour force (working and seeking work) by sex by age, State/Region and District, 2014 Census / 202

A2.24 Percentage of employed children/youth in conventional households by age by sex by occupation, urban and rural areas, 2014 Census / 204
A2.25 Percentage of employed children/youth in conventional households by age by sex by industry, urban and rural areas, 2014 Census / 205
A2.26 Percentage of children and youth aged 10-19 by sex by age by main economic activity, urban and rural areas, 2014 Census / 207
A2.27 Percentage of youth by highest level of education by sex by age, urban and rural areas, 2014 Census / 210
A2.28 Labour force participation among children and youth aged 10-29 by sex by age, urban and rural areas, 2014 Census / 212
A2.29 Economic activity among children and youth aged $10-29$ by sex by age, urban and rural areas, 2014 Census / 218
A2.30 Percentage of employed children and youth in conventional households by occupation by age by sex, urban and rural areas, 2014 Census / 227
A2.31 Percentage of employed youth aged 15-29 by occupation by highest educational attainment by sex, urban and rural areas, 2014 Census / 230
A2.32 Percentage of employed children and youth by industry by age by sex, urban and rural areas, 2014 Census / 233
A2.33 Percentage of population aged 15-49 by marital status by sex by age, 2014 Census / 236
A2.34 Adolescent ever-married rate for 15-17 and 15-19 year olds by sex, State/Region and District, 2014 Census / 239
A2.35 Lifetime internal migrants among children and youth by sex by age by type of move, 2014 Census / 241
A2.36 Lifetime migrants aged 15-24 by type of move by sex, State/Region, 2014 Census / 244
A2.37 Percentage distribution of lifetime internal inter-State/Region migrant youth aged $15-24$ by sex by type of move by wealth index quintile, 2014 Census / 245
A2.38 Less than one- and less than five-year recent migration rates for youth, by age and sex, 2014 Census / 246
A2.39 Former household members aged 15-24 living abroad by sex by State/Region and District of reporting household, 2014 Census / 247
A2.40a Numbers of households with and without an emigrant youth by wealth index quintile, State/Region and District, 2014 Census / 249
A2.40b Percentage of households with and without an emigrant youth by wealth index quintile, State/Region and District, 2014 Census / 256
A2.40c Differences in the percentages of households with and without emigrant youth by wealth index quintile, State/Region and District, 2014 Census / 263

## Executive Summary

Children and youth are the future of any country. This thematic report presents the situation of children and youth in Myanmar using data from the 2014 Population and Housing Census (hereafter referred to as the 2014 Census). Specifically, the report seeks to assess firstly, how well the children of Myanmar are being given a good start in life through better health, a nurturing home environment and educational opportunities; and secondly, whether or not youth are transitioning to adulthood in ways that will contribute to the economic and social development of the country. The report defines children as persons aged 0-14 and youth as persons aged $15-24$. This is to ensure comparability with data reported from past censuses and surveys and with the United Nations recommendations. However, to make the report as relevant to as wide a group of users as possible, in some instances, key indicators for children aged 0-17 and youth aged 15-29 are also presented.

The 2014 Census enumerated 14.4 million children in Myanmar, constituting 29 per cent of the total population; and 9 million youth, constituting a further 18 per cent of the total population. Together, the two population groups comprised 23.4 million persons, 46.5 per cent of the total population. Most live in rural areas (three quarters of children and two thirds of youth). Half of all rural children and youth live in the large rural States/Regions of Ayeyawady, Shan, Sagaing and Mandalay, while half of all urban children live in Yangon and Mandalay.

The child dependency ratio has decreased from 67.1 children to every 100 adults in the working-age group 15-64 years in 1983 to 43.7 in 2014, and is projected to decline further over the next thirty years to 32.5 by 2044. Furthermore, the absolute numbers of children and youth have only grown from 20.2 million in 1983 to 23.4 million in 2014 and are projected to stabilize at about that level until around 2044.

More than four out of every five children and youth in conventional households ( 87 per cent and 85 per cent, respectively) live in owner-occupied housing units. Only a small proportion of children live in condominiums/apartments/bungalows/brick houses ( 9 per cent) compared with youth ( 12 per cent). Two thirds of children ( 66 per cent) live in households with access to an improved source of drinking water compared to 70 per cent of youth. Slightly larger proportions of children and youth live in households with access to improved sanitation (69 per cent and 75 per cent respectively). These patterns are observed in both urban and rural areas as well as across States/Regions. Thirty-two per cent of children live in households which use kerosene or candles as the main source of energy for lighting, while 86 per cent live in a household which uses solid fuels or kerosene for cooking. The use of these fuels put children at risk of diarrhoeal and respiratory diseases, poisoning and fire. More than two thirds of rural children and one fifth of urban children live in a household with two or more of these health risks.

A larger proportion of children live in households with neither a television nor a radio ( 37 per cent) compared with youth ( 30 per cent), while 42 per cent of children and 35 per cent of youth live in a household without either a bicycle or a motorcycle. Being without any mode of transport is more common in rural than in urban areas.

Most children live in a household headed by a parent (three quarters) or a grandparent (one fifth), while a few (about 5 per cent) live without a parent. Close to 60,000 children under the
age of five (or 1.3 per cent of all children in this age group) were enumerated in an institution. Out of 1,000 live births, 62 Myanmar infants die before their first birthday while 72 die before they are five years old. Child mortality is higher in rural areas.

Seventy-one per cent of primary school age children (aged 5-9) are currently attending school. A higher proportion of children (aged 10-13) attend lower secondary/middle school. However, only about half (51 per cent) of upper secondary/high school age children (aged 14-15) are currently attending school, with this proportion being even lower in rural areas (47 per cent). The proportion for urban areas is 59 per cent. The pattern where current school attendance is lowest among upper secondary school age children is observed across States/ Regions. However, there are wide variations between States/Regions in attendance levels of children of all school ages, with Chin and Kachin having the highest rates while Shan and Bago report the lowest.

Eighteen per cent of children aged nine had completed primary education, while 45 per cent and 68 per cent of children aged 10 and 11 respectively had completed primary education, indicating that many children start formal school at the age of six or seven. The completion rate declined after primary school. Children aged 14 to 16 years are expected to have completed their middle school grades. However, only 32 per cent of children aged 14 years and 26 per cent of children aged 16 years had done so.

Eight per cent of children aged 10-13 in Myanmar are working, with this proportion being more than twice as high in rural areas ( 9 per cent) than in urban areas ( 4 per cent). Shan State has the highest proportion of working children (17 per cent) which is more than twice the proportions in the second highest Regions of Magway and Sagaing. The lowest proportions of working children are in Chin, Rakhine, Kachin and Tanintharyi (less than 5 per cent). Using the international definition of a child as a person below the age of 18 , about one in five children aged 10-17 ( 21 per cent) in Myanmar are working, with this proportion being a little higher among boys ( 23 per cent) than girls (19 per cent), and higher among children in rural areas (23 per cent) than those in urban areas (15 per cent). The need to send children to work is one reason why many do not complete their schooling, but it is not the only factor.

Most youth live with their parents. This reflects a strong cultural preference for living with the family as well as, particularly in urban areas, the lack of available and affordable housing. Eighty six per cent of youth aged 15-19 live in a household headed by a parent or other family member (grandparent or sibling) while 71 per cent of those aged 20-24 do so. Only at ages 25-29 are 47 per cent living independently (as head/spouse, with other relatives and nonrelatives). Urban youth are more likely to be living in a non-family headed household while rural youth, who on average marry earlier than urban youth, are more likely to be heading their own household.

Three in five of young males aged 15-19 (60 per cent) and 44.2 per cent of young females are in the labour force. For males the rate continues to increase throughout their twenties, reaching 92.3 per cent by ages 25-29. The labour force participation rate for females increases to 59.7 per cent at ages 20-24, but then levels drop off and even decline slightly to 57.7 per cent at ages 25-29.

Rural and urban youth work in very different occupations and industries. Two thirds of employed rural youth work in the agricultural sector while urban youth have diverse occupations (18 per cent work in manufacturing; 18 per cent in trade; 12 per cent in construction; and 10 per cent in food and accommodation services).

The distribution of youth in occupations and industries is fairly uniform from ages 15 to 29, suggesting that most youth continue to do the same type of work that they did when they started working. Advancing into more productive areas may be very difficult, perhaps because of the educational requirements to be employed in some industries.

Most employed children aged 10-13 work as skilled agricultural, forestry and fishing workers ( 43 per cent) and in elementary occupations ( 23 per cent). This pattern is observed among both males and females as well as in rural areas. In urban areas, most children work as services and sales workers (29 per cent) and craft and related trades workers ( 25 per cent).

In many low and middle income countries, youth unemployment and youth who have given up looking for work present serious social and economic problems. This is not the case in Myanmar where youth unemployment is low (9 per cent) compared to other ASEAN countries. The Census revealed that the more education a youth has received, the more likely he or she is to be unemployed. Ten per cent of male youth are not in full-time education nor employed: 11 per cent in urban areas and 9 per cent in rural areas. The rate is much higher for females (29 per cent) but falls to 4 per cent if 'household production' (housework) is counted as an economic activity.

Most youth have never married; among 20-24 year olds, only 44 per cent of females and 30 per cent of males have married. One of the many factors leading to the rise in age at marriage and the declining proportions married is the trade-off that young women have to make between work and family. Young women in urban areas have particularly difficult choices. They strive to gain higher education to be able to get a good job, but marriage and children may mean that they will have to leave that work and forgo the income that it brings. Unmarried females aged 20-24 in urban areas have a labour force participation rate of 67 per cent compared with 45 per cent for those who are married with no children and only 29 per cent for those with at least one child. The pattern is similar for young rural women aged 20-24.

At the Union level, 6 per cent of girls aged 15-17 are married, but in Shan State the proportion is 9 per cent and in Ayeyawady and Nay Pyi Taw it is 8 per cent. The adolescent fertility rate at the Union level (live births to 15-19 year olds per 1,000 females of the same age) is 33 . Shan and Chin have the highest adolescent fertility rates at 59 and 50 respectively.

Although most youth remain in the Township of their birth, almost one in five ( 19 per cent) of youth aged 15-24 have moved from the Township where they were born. Internal migration becomes increasingly more common as young people get older. The most common form of migration within Myanmar is between States or Regions; 57 per cent of youth who are lifetime migrants have moved to another State/Region. Yangon is the main destination for young migrants and almost half (48 per cent) of all inter-State/Region lifetime migrants
aged 15-24 have moved to Yangon from nearby States/Regions.

A total of 671,000 people left Myanmar as a youth prior to the 2014 Census, which means that there are at least eight youth who live abroad for every 100 living in Myanmar. In some border Districts, the ratio is 50-60 youth living abroad for every 100 living in Myanmar. About 60 per cent of international emigrants are males.

The results presented in this report show the need to invest in a healthy foundation for children, especially in rural areas, by improving access to safe water and sanitation, better availability of electricity and affordable health care. There is also a need to invest in meaningful and accessible education by reducing the obstacles that children face in attending school beyond primary level; and for increasing the quality of education so that the benefits of staying in school are apparent to both children and parents.

There is a need to make it less hard for youth to gain decent employment through vocational training and encouraging industries to install safety mechanisms at work; and to encourage female labour force participation by addressing cultural and other obstacles that women face in the workplace. One way to increase children's and youth's capacity to contribute to national development is to give targeted support to those who face significant disadvantages. These include children living in houses built in part from bamboo, or living in a hut, or other types of dwelling units; children living in households with neither a television nor a radio; those children who have never attended school; and children who live with some form of disability.

## Chapter 1. Introduction

### 1.1 Background

### 1.1.1 Children, youth and development

The living conditions of children and youth and their experiences as they progress towards adulthood are critical for understanding the challenges and opportunities for national development. Children and youth are important demographically, economically and as the parents and leaders of upcoming generations.

The number of children and youth living today is the result of declining fertility over the past 40 to 50 years. In the mid-1960s the average woman in Myanmar had five and a half children throughout her life. This declined to about three and a half children around 1990. Based on the 2014 Census, in 2013 the average woman had two and a half children. Most of the decline in fertility occurred in the 1980s and 1990s. Although there has not been a detailed analysis of the factors driving the country's fertility decline, it has almost certainly been affected by the nation's development from a rural, subsistence economy to one that is more marketdriven.

A consequence of the fertility decline has been a slowing down of the absolute number of births and a reduction in the population growth rate. Population projections suggest that the numbers of children and youth (in total) will remain steady, though the numbers in some particular age groups, and their total proportion of the population, will fall. This means that there will be a growing number of adults of working age to invest in children and youth, helping them to be healthier, better educated, and more productive adults. This demographic change will be described in more detail in Chapter 2.

Children and youth are vital to the current and future economy. This period in life is an important time to gain knowledge and skills that can result in a more productive labour force. The more opportunities they have to continue in education and to find employment, the greater their contribution will be to the economy. Young people today are better educated than their parents, they are postponing marriage, and are likely to have fewer children. Analysis of the early economic successes in East Asian countries attributes 25 to 40 per cent of the economic growth to the ability of the country to put the large numbers of young people of working ages into productive employment, following rapid fertility declines (Bloom, Canning and Malaney, 2000).

Education is a way of securing a better future. Analysis of poverty dynamics from the Integrated Household Living Conditions Survey (2009-2010) found that people who were literate and had completed at least primary school were more likely to 'escape' from poverty than those without an education (IHLCA Project Technical Unit, 2011). Furthermore, educated parents, and especially educated mothers, have fewer and healthier children.

Children and youth need the support of their respective families, their wider communities and the Government. Indeed, they are not physically or emotionally mature, and they do not have the knowledge and skills they need to support themselves and a family (WHO, 2014).

The goal of the National Comprehensive Development Plan is to improve the quality of

## Chapter 1. Introduction

education and health systems and to promote industrialization and other economic reforms in order to give people a better quality of life (Myanmar Development Cooperation Forum, 2013). Yet the country is amongst the poorest in South-East Asia. According to the World Development Indicators from the World Bank's databank, gross national income per capita was only US $\$ 1,270$ in 2014. Transport infrastructure is poor and most of the population living in rural areas have no electricity. The economy is dominated by agriculture and the level of manufacturing and other industry is low.

Fortunately, there is a strong evidence base for devising policies and programmes that will promote national development while benefiting children and youth, through:

- Investing in quality services for children and youth
- Creating opportunities for employment and reducing barriers to employment
- Giving people second chances and protecting those in greatest need.

Myanmar already has a strong policy framework for designing and implementing pro-child and youth programmes. The 2014 Amendments to the Child Law provide a legal framework for the minimum ages for work and marriage, and stress the importance of equal access to basic schooling and the protection of children under the age of 18 with a disability, children in conflict with the law, or children in need of special protection. The 'Five-Year Strategic Plan for Young People's Health' (2016-2020) recognizes that adolescent years (defined in this particular context as those aged 10-24), are critical periods of life.

Young people face a heightened risk of infectious diseases, unwanted pregnancies, road traffic injuries, assaults, including violence against women, and the use and abuse of alcohol, tobacco and other substances. The strategic plan aims to promote healthier behaviours through creating greater awareness among youth and increasing the capacity of teachers and health professionals to address these issues. In addition, educational reforms are prioritizing the increased provision of vocational training linked to growth industries (Tanaka, Spohr, and D'Amico, 2015). Centres have been established around the country to help older children and youth receive accurate information on employment and migration opportunities within and across national borders.

### 1.1.2 Defining a child and youth

Defining who is a 'child' and who is a 'youth' is not straightforward, as the definitions vary depending on the context. The 1993 Child Law (2014 Amendments) of Myanmar, for example, defines a child as a person aged under 18, while for statistical purposes, the United Nations defines a child as a person aged 0-14 and a youth as a person aged 15-24 (United Nations, 2008).

International conventions, national policies and programmes and census enumeration procedures all contributed to the selection of the age groupings used in this report. The primary classification is 0-14 years for children and 15-24 years for youth. This is to ensure comparability with other data from past censuses and surveys, in line with the United Nations recommendations (United Nations, 2008).

## Chapter 1. Introduction

To make this report as useful to as many users as possible, key indicators for children and youth are also given in five-year age groups. In addition, other age groups are considered when relevant for specific topics. The age group 0-17 (or 10-17 or 15-17 depending on data availability) is used to highlight the conditions of children and youth below the age of majority. In Chapter 6 on children's education and labour, some information is presented using age groups associated with the different levels of the education system. When describing labour force participation (in Chapter 7, for example), information reflects age categories related to the legal ages of employment and takes into account the former Ministry of Labour's definition of youth as being those aged 15-29, following the International Labour Organization's (ILO) convention for some indicators.

The transition of Myanmar's children to adulthood, such as living apart from parents and working, starts as young as the age of 10 . The more fortunate remain in the parental home to finish school and start employment later. To understand the pace of these important life changes, and to explore the differences between urban and rural areas as well as between States/Regions, much of the analysis of youth starts at the age of 10 and continues to age 29.

Not all the 2014 Census questions were asked of all children. Questions on economic activity, occupation and industry, for example, were asked of those aged 10 and over. And following demographic conventions, questions about children ever born and the last birth were only asked of ever-married women aged 15 and over. Marital status was asked of every person aged 10 and over; those under 10 were assumed to be unmarried. School attendance was only reported for persons aged five and over.

### 1.2 Objectives of the report

This report uses the recent Census data to analyse the living conditions of children and youth. It examines the foundations for adulthood: being safe from health risks in the home; living with family in the early years; having access to the means to complete education; gaining decent employment with the potential for advancement; and starting to form their own households and families. The report also looks at the disability status of children and youth.

This report addresses two broad questions:

- How well are the children of Myanmar being given a good start in life through better health, a nurturing home environment and educational opportunities?
- Are youth transitioning to adulthood in a way that will enable them to contribute to the economic and social development of the country?

### 1.3 Data quality and limitations

The 2014 Census is the country's first census in three decades. In the post-independence period, two comprehensive population and housing censuses were undertaken in 1973 and 1983, respectively. The 2014 Census aimed to enumerate all persons who were within the

Chapter 1. Introduction
borders of Myanmar on the night of 29th March 2014 (Census Night). Technical details of the Census are available in previously published reports (Department of Population, 2014a, 2015).

Some populations in three areas of the country were not enumerated. This included an estimate of 1,090,000 persons residing in Rakhine State, 69,800 persons living in Kayin State and 46,600 persons living in Kachin State (see Department of Population, 2015, for the reasons that these populations were not enumerated). In total, therefore, it is estimated that $1,206,400$ persons were not enumerated in the Census. The estimated total population of Myanmar on Census Night, both enumerated and non-enumerated, was 51,486,253.

The analysis in this report covers only the enumerated population. It is worth noting that in Rakhine State an estimated 34 per cent of the population were not enumerated as members of some communities were not counted because they were not allowed to self-identify using a name that was not recognized by the Government. The Government made the decision in the interest of security and to avoid the possibility of violence occurring due to intercommunal tension. Consequently, data for Rakhine State, as well as for several Districts and Townships within it, are incomplete, and only represent about two thirds of the estimated population. Any such data should therefore be treated with caution. In the rest of the States/ Regions and at the Union level, the indicators can be regarded as accurate.

The 2014 Census enumerated the population living in both conventional households and institutions. Institutions include hospitals, prisons, work camps, barracks and religious institutions among others. Some Census information, including data on literacy, school attendance, occupation and industry, migration, mortality and fertility were not collected for the institutional population.

A further feature of the 2014 Census is that people in conventional households were asked about former household members living abroad. Two million people were reported to be living abroad. Nearly half (47 per cent) first left when they were aged between 15 and 24. The number of two million is widely assumed to be an underestimate, not only because of households' concerns about reporting unregistered migrations but also because in some instances the entire household may have migrated or because the migrant had previously been living in an institution. The analyses of fertility and mortality rates have taken this into account.

This report is concerned with the pace and variation in transitions to adulthood, so age is a crucial variable. Unfortunately, in countries with a legacy of low education levels, age is also one of the most difficult characteristics on which to collect accurate information, and poses challenges to the editing of reported responses. A common problem encountered in age reporting in censuses is the inability of respondents to accurately recall their exact age or date of birth, resulting in the rounding of their age during the interview to the closest number ending in zero or five, or a culturally significant age such as 18 . This may lead to age heaping once the collected data are tabulated.

The 2014 Census thematic report on Population Dynamics (Department of Population,

## Chapter 1. Introduction

2016a) measured the extent of age heaping in the data and found that it was definitely present, and that the resulting age distribution is on the borderline of being 'reasonable' and 'inaccurate'. Among children and youth, there were some preferences for reporting ages 10,12 to $14,18,20$ and 25 (Figure 1.1). The pattern is not pronounced but could contribute to some uneven patterns by single year of age.

Figure 1.1
Reported number of children and youth by single year of age, 2014 Census

Many topics of potential importance concerning children and youth are not generally covered in a census, and are therefore beyond the scope of this report. These include civic engagement, such as voting, and aspects of health of particular concern among older children and youth such as mental health, the use of alcohol, tobacco and other drugs, and the risk of trauma including road injuries and interpersonal violence. These dimensions should not be forgotten even though they cannot be addressed here.

### 1.4 Overview of the report

The present report is one of a series of thematic reports designed to provide users with a more complete set of data from, and insights into, the 2014 Census. Other reports consider a range of topics covering mortality, maternal mortality, fertility and nuptiality, migration and urbanization, population dynamics, population projections, gender dimensions, housing conditions and household amenities, education, the labour force, disability and the older population.

This report has benefited from the detailed analysis that has already been undertaken on the results of the Census. Drawing on all of the thematic topics above, the report uses a child and youth lens to investigate their particular characteristics. It starts with the demographic foundations, and then moves to the living conditions of children and youth. The following chapters appraise the life course starting with early childhood; schooling and child labour; youth's educational attainment; entry and progression into the workforce; marriage; and migration.

## Chapter 2. Demographic characteristics of children and youth

Today's cohorts of children and youth are the largest in history (UNFPA, 2014). Globally nearly half of the 7.4 billion people are aged under 25 . This is also true for Myanmar. The 2014 Census provides the first comprehensive information on children and youth since the last census in 1983, more than thirty years ago. It enumerated 23.4 million children and youth aged $0-24$, comprising 46.5 per cent of the total population. There are 3.2 million more children and youth in 2014 than enumerated in the 1983 census, and 6.5 million more than enumerated in the 1973 census. However, they comprise a smaller percentage of the total population. Children and youth made up 59 per cent of the population in 1983 and as much as 60 per cent in 1973.

As a result of a gradual fertility decline since 1983, the absolute numbers of children and youth are growing relatively slowly. This new dynamic means that the Government, development partners, private business, civil society and families have the opportunity to invest more in improving the opportunities for children and youth to have a healthy and productive future.

### 2.1 Population size and geographic distribution

Of the 50.3 million people counted in the 2014 Census, 23.4 million, or 46.5 per cent of the total population, were children and youth aged under 25 . Children aged under 15 accounted for 14.4 million ( 28.6 per cent) and youth aged 15-24 accounted for 9 million (17.8 per cent) of the total population.

Table 2.1 shows that half of children and youth aged $0-24$ live in the four most populous States/Regions: Yangon, Shan, Ayeyawady and Mandalay. Eighty two per cent live in eight States/Regions. However, the States/Regions with the largest share of the proportion of children and youth do not necessarily have the largest numbers of young people. For example, though Yangon has the greatest share of the total population aged 0-24 (14 per cent) it has the second to lowest percentage of its population in this age group ( 44 per cent), while the highest proportion of the population aged under 25 ( 57 per cent) in Chin, accounts for only 1 per cent of the share of the country's children and youth.

Myanmar is primarily a rural country. Seven out of every ten children and youth live in rural areas, the same proportion as the total population. Figure 2.1 shows that the proportions of children and youth living in rural and urban areas are not evenly distributed. In terms of proportions, Yangon is home to 34 per cent of all urban children and youth; an additional 15 per cent live in Mandalay. These two Regions thus comprise nearly half of all urban children and youth. Conversely, half of all rural children and youth live in Ayeyawady, Shan, Sagaing and Mandalay.

## Table 2.1

Distribution of children and youth ranked by State/Region, 2014 Census

| State/Region | Population aged <br> $\mathbf{0 - 2 4}$ | Percentage of <br> total population | Percentage of Union <br> population | Cumulative percentage <br> of Union population |
| :--- | ---: | ---: | ---: | ---: |
| UNION | $\mathbf{2 3 , 3 5 6 , 6 2 7}$ | $\mathbf{4 6 . 5}$ | $\mathbf{1 0 0}$ |  |
| Yangon | $3,218,110$ | 43.7 | 13.8 | 13.8 |
| Shan | $2,964,427$ | 50.9 | 12.7 | 26.5 |
| Ayeyawady | $2,825,674$ | 45.7 | 12.1 | 38.6 |
| Mandalay | $2,740,413$ | 44.4 | 11.7 | 50.3 |
| Sagaing | $2,451,584$ | 46.0 | 10.5 | 60.8 |
| Bago | $2,193,995$ | 45.1 | 9.4 | 70.2 |
| Magway | $1,678,254$ | 42.8 | 7.2 | 77.4 |
| Rakhine | $1,009,086$ | 48.1 | 4.3 | 81.7 |
| Mon | 975,587 | 47.5 | 4.2 | 85.9 |
| Kachin | 830,079 | 50.5 | 3.6 | 89.4 |
| Kayin | 779,081 | 51.8 | 3.3 | 92.8 |
| Tanintharyi | 724,419 | 51.4 | 3.1 | 95.9 |
| Nay Pyi Taw | 538,892 | 46.4 | 2.3 | 98.2 |
| Chin | 273,378 | 57.1 | 1.2 | 99.3 |
| Kayah | 153,648 | 53.6 | 0.7 | 100 |

Figure 2.1
Percentage of children and youth aged 0-24 years in urban and rural areas, State/Region, ranked by size of urban population, 2014 Census

## Chapter 2. Demographic characteristics of chilldren and youth

Figure 2.2
Relative size of the population of children and youth aged 0-24 in urban and rural areas, State/ Region, 2014 Census

## Chapter 2. Demographic characteristics of children and youth

Another way to view where children and youth live is shown in the map at Figure 2.2. The size of the circles on the map are proportional to the size of the population of children and youth in each State/Region. The pink and blue slices of the pie chart show the proportions living in urban and rural areas, respectively. The map shows the more populated States/Regions lying in the centre of the country, from Yangon and Ayeyawady to Sagaing and Shan. Appendix 2, Table A2.1 presents the numbers from which Figure 2.2 was derived.

### 2.2 Population growth

The population of Myanmar has grown steadily between the 1973 and 2014 censuses. The total population nearly doubled from 28.1 million in 1973 to 50.3 million in 2014 . However, as a result of a decline in fertility, over the same period the total number of children and youth only grew by 38 per cent from 16.9 million to 23.4 million (Table 2.2 ). The official population projections, assuming continued fertility decline and improvements in child mortality, anticipate that over the next ten years the number of children and youth will increase very little, and that in the following two decades the numbers will even decline from 24.5 million in 2024 to 23.1 million by 2044 (Department of Population 2017a). Figure 2.3 shows the population totals in broad age groups: children aged 0-14; youth aged 15-24; adults aged 25-64; and the population aged 65 and over.

Table 2.2
Past and projected number of children and youth by sex, 1973-2044

| Age group/Sex | Censuses |  |  | Projections |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1973 | 1983 | 2014 | 2024 | 2034 | 2044 |
| Both sexes |  |  |  |  |  |  |
| 0-14 | 11,643,840 | 13,159,645 | 14,399,569 | 14,675,392 | 14,500,291 | 13,570,845 |
| 15-24 | 5,239,473 | 7,021,759 | 8,957,058 | 9,855,744 | 9,456,655 | 9,547,981 |
| 0-24 | 16,883,313 | 20,181,404 | 23,356,627 | 24,531,136 | 23,956,946 | 23,118,826 |
| Male |  |  |  |  |  |  |
| 0-14 | 5,865,616 | 6,663,105 | 7,296,904 | 7,421,185 | 7,350,391 | 6,892,361 |
| 15-24 | 2,578,504 | 3,454,558 | 4,382,523 | 4,973,919 | 4,754,705 | 4,817,038 |
| 0-24 | 8,444,120 | 10,117,663 | 11,679,427 | 12,395,104 | 12,105,096 | 11,709,399 |
| Female |  |  |  |  |  |  |
| 0-14 | 5,778,224 | 6,496,540 | 7,102,665 | 7,254,207 | 7,149,900 | 6,678,484 |
| 15-24 | 2,660,969 | 3,567,201 | 4,574,535 | 4,881,825 | 4,701,950 | 4,730,943 |
| 0-24 | 8,439,193 | 10,063,741 | 11,677,200 | 12,136,032 | 11,851,850 | 11,409,427 |

## Chapter 2. Demographic characteristics of children and youth

Figure 2.3
Past and projected population growth by population group, 1973-2044

Figure 2.4
Average annual change in the number of children and youth between censuses and decennial projections, 1973-2044

Figure 2.4 shows the past and projected annual changes in the numbers of children and youth. The relatively small increase of children between 1983 and 2014, and the near stable or decline in the number of children and youth projected for the next thirty years, is, as has already been noted, the result of a decline in fertility.

Chapter 2. Demographic characteristics of children and youth

### 2.3 Age and sex composition

### 2.3.1 Child dependency ratios

The child dependency ratio (CDR) is the ratio of the population of children aged 0-14 to the working-age population aged 15-64, per 100 working-age persons. It is an indication of the number of children that people in their productive years must support. At the Union level, it can be regarded as the ratio between the population in greatest need of public education and health care services, and the population that contributes more to the economy through paid and unpaid work than they take from such services. The higher the child dependency ratio, the greater the number of children that working-age adults must support, and the more challenging it becomes to provide for children's education and health care.

Table 2.3 shows that from 1973 to 2014 the child dependency ratio declined rapidly (see also Department of Population, 2015), and the current population projections show that this trend will continue for the next thirty years as a result of a continued growth in the workingage population and the decline in the number of children.

Table 2.3
Child dependency ratio, 1973-2044

|  | Censuses |  |  | Projections |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1973 | 1983 | 2014 | 2024 | 2034 | 2044 |
| CDR | 75.6 | 67.1 | 43.7 | 38.9 | 36.2 | 32.5 |

At the State/Region level, Yangon had the lowest child dependency ratio in 2014 (33) and Chin State (which, as will be seen in Chapter 8, had the highest level of fertility), had the highest ratio (Figure 2.5). In all States/Regions, the child dependency ratio is lower in urban areas than in rural areas though the difference varies across the country (Figure 2.6). While there is very little difference in Kachin, for example, in Chin the rural ratio is higher by 24.5 percentage points. (See also Appendix 2, Table A2.2).

Figure 2.5
Child dependency ratio, State/Region, 2014 Census

Chapter 2. Demographic characteristics of children and youth

Figure 2.6
Child dependency ratio, urban and rural areas, State/Region, 2014 Census

### 2.3.2 The youth bulge

Some populations have a pronounced 'youth bulge'; that is, where the percentage of the total working-age population who are aged $15-24$ is high and rising. This occurs when fertility has declined very quickly, creating a temporary 'bulge' in the age distribution as the largest birth cohort subsequently age.

If the population of working age increases and can be fully employed in productive activities, other things being equal, the level of average income per capita should increase as a result. This is called the 'demographic dividend' - a benefit that comes from rapidly declining fertility (Bloom, Canning, and Sevilla, 2003). However, if many youth and young adults cannot find decent work, the 'youth bulge' within the working-age population will become a demographic burden. In some parts of the world, a large mass of frustrated youth has added to social and political instability (World Bank, 2006). (A more detailed discussion of the demographic dividend is given in Department of Population, 2016a).

At the Union level, the proportion of youth in the working-age population is largely determined by the level and pace of fertility decline that took place more than 15 years ago. The migration of young people (mainly out of the country) has some impact, but is not a major factor. A youth bulge (or youth deficit) does occur, however, where migration rates into (or out of) a State/Region are high and dominated by youth seeking employment opportunities. This can be seen in Figure 2.7 where there was a lower than average proportion of youth among the working population in Magway, Ayeyawady and Bago, where some areas have high outmigration.

The percentage of youth in the working-age population was highest in Kachin, Chin, Kayah and Shan (see also Appendix 2, Table A2.2). This will be explored in more detail in Chapter

## Chapter 2. Demographic characteristics of children and youth

9. One of the characteristics of youth migration in Myanmar is that youth tend to move from rural areas to a nearby urban area, and from smaller urban areas to larger cities. This can be seen from the difference in the urban and rural areas in Mandalay, and the lower than average proportion of youth in urban Ayeyawady and Bago, which are the main areas of origin for young migrants to Yangon. (Appendix 2, Table A2.3 provides more details of the size of the urban and rural populations by age group for each State and Region).

Figure 2.7
Youth as a proportion of the working-age population, urban and rural areas, State/Region, 2014 Census

Viewed from a regional perspective, Myanmar's age structure is fairly typical of ASEAN countries. Figure 2.8 shows that it is more youthful than those countries with lower fertility rates such as Singapore and Thailand, but less youthful than Cambodia, the Philippines and Lao PDR where a decline in fertility rates has been even slower than in Myanmar.

Chapter 2. Demographic characteristics of children and youth

### 2.3.3 Sex ratio

Demographers use the sex ratio, that is, the number of males in a population per 100 females, to investigate the balance between the sexes. Sex ratios can be very informative about the underlying demographic, social and economic dynamics of a population.

In all human populations, more boys than girls are conceived. In normal populations, the sex ratio at birth varies between around 102 and 107. While boys have slightly higher child mortality rates, the preponderance of boys to girls continues throughout childhood. However, as they grow older, males have a higher probability of dying at each age. Consequently, among the older population, there are usually many more surviving females than males. Therefore, in a normal population, overall there will be more females than males among the older population, and the sex ratio in the total population will be below 100.

The main exceptions to this trend are in societies where boys are more highly valued than girls (UNFPA APRO, 2012). For instance, if a society prefers male children and uses technology to identify the sex of the foetus, sex ratios at birth may rise above 110. Even without sexselective termination of pregnancy, social attitudes to girls can lead to greater neglect and higher mortality rates. As infants grow, such neglect of girls can result in higher female infant mortality, raising the sex ratio.

In Myanmar there is an equal preference for sons and daughters (DoP and UNFPA, 2009, Chapter 2). For the Union as a whole, the sex ratio of children aged under one is 102.4, which is within the usual range. As Table 2.4 shows, the sex ratio of children does not exceed 107 in the urban or rural areas of any State/Region. Child sex ratios are higher in urban areas in

Chapter 2. Demographic characteristics of children and youth
most States/Regions. This is true even for children under five, but the reason behind this is not clear. (Appendix 2, Table A2.3 presents the numbers from which the sex ratios have been derived).

Table 2.4
Sex ratio* of children and youth, urban and rural areas, State/Region, 2014 Census

| State/Region | Total |  | Urban |  | Rural |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Children | Youth | Children | Youth | Children | Youth |
| UNION | 103 | 96 | 105 | 98 | 102 | 95 |
| Kachin | 103 | 124 | 103 | 109 | 103 | 134 |
| Kayah | 103 | 105 | 102 | 103 | 103 | 106 |
| Kayin | 103 | 100 | 105 | 102 | 103 | 99 |
| Chin | 102 | 89 | 101 | 89 | 102 | 89 |
| Sagaing | 102 | 92 | 105 | 97 | 101 | 90 |
| Tanintharyi | 103 | 100 | 104 | 95 | 103 | 102 |
| Bago | 103 | 93 | 105 | 95 | 102 | 92 |
| Magway | 101 | 86 | 103 | 95 | 100 | 85 |
| Mandalay | 103 | 96 | 107 | 106 | 102 | 90 |
| Mon | 104 | 96 | 106 | 101 | 103 | 94 |
| Rakhine | 103 | 86 | 104 | 94 | 102 | 84 |
| Yangon | 104 | 95 | 104 | 94 | 104 | 95 |
| Shan | 102 | 102 | 107 | 105 | 101 | 101 |
| Ayeyawady | 102 | 97 | 104 | 96 | 102 | 97 |
| Nay Pyi Taw | 103 | 97 | 105 | 99 | 103 | 96 |

* Males per 100 females.

However, there is considerable variation across the country in sex ratios of youth aged 15-24. The highest youth sex ratio is in rural Kachin, where there is a lot of mining. The lowest sex ratios - where there are more females than males - are in areas where there is an outmigration of males to work elsewhere in Myanmar or across international borders, or, in urban Yangon, where there is a large influx of females seeking work. These sex-selective migration trends will be discussed in detail in Chapter 9.

### 2.4 Summary

Children and youth comprised 46.5 per cent of the 50.3 million people counted in the 2014 Census. There were 14.4 million children aged $0-14$ and 9 million youth aged 15 to 24 .

Similar to the profile of the total population, approximately 70 per cent of children and youth live in rural areas. Yangon and Mandalay comprise nearly half of all urban children and youth while half of all rural children and youth live in Ayeyawady, Shan, Sagaing and Mandalay.

The numbers of children and youth have grown steadily between the 1973 and 2014 censuses. However, the rate of growth is slowing. Population projections based on the 2014 Census anticipate that there will be 24.5 million children and youth by 2024, but that there will be fewer ten years later ( 24.0 million) and fewer still by 2044 ( 23.1 million). The child dependency ratio will start declining earlier: from 43.7 children to 100 persons of working age in 2014 , to 38.9 in 2024, 36.2 in 2034 and 32.5 in 2044.

## Chapter 2. Demographic characteristics of children and youth

The sex ratio (males to 100 females) for children is within the normal range of 102 to 107 but different migration patterns for males and females result in more extreme youth sex ratios in some areas. For example, urban Yangon has more female youth than male youth, while in rural Kachin, where there is a concentration of mining activity, there are as many as 134 males for every 100 females.

## Chapter 3. Housing, infrastructure, services and assets - the hardware for health

Safe and affordable housing is essential for the health and development of children and youth. The current state of housing is poor in both urban and rural areas of Myanmar, and improving access to quality housing is a priority for the Government. An estimated 30 per cent of people in urban Myanmar live in sub-standard accommodation characterized by a lack of secure tenure, over-crowding and limited energy, water and sanitation services, due to large numbers of people migrating to cities from other parts of the county and a scarcity of modern affordable housing for households of low and low-to-middle incomes (U Khin Mg Thein, 2014). In rural areas, the basic infrastructure is lacking, with the majority of rural households not connected to the electricity grid and without access to improved sources of water and sanitation (World Bank, 2014; Department of Population, 2017b). In some parts of the country, rural people have been displaced due to natural disasters or on-going conflict and are living in temporary and inadequate accommodation.

The Government of Myanmar is addressing these issues on multiple fronts, encouraging greater public and private investment in affordable urban housing, developing land use policies and plans, and improving rural infrastructures. The information contained in the 2014 Census is important for informing these plans and monitoring progress.

The 2014 Census asked several questions about the characteristics of the dwellings of conventional households (see Appendix 1). These included ownership of the dwelling; the type of structure; and the construction materials of the walls, roof and floor. Information was also collected on amenities - cooking fuel, lighting, sources of drinking and non-drinking water, and type of toilet - that have a direct impact on risks to health. In addition, there is information on household's access to transport and communication assets. These are key assets that enable households to connect to education and health services as well as employment and markets.

This chapter looks at housing characteristics and access to household services as they affect children and youth. It refers to, and builds on, the data reported in the 2014 Census thematic report on Housing Conditions and Household Amenities (Department of Population, 2017b). The characteristics of children's and youth's domestic environment are discussed separately under housing characteristics, risks to health, and transport and communication.

### 3.1 Housing type and tenure

Growing up in poverty is one of the greatest threats to healthy child development (MNPED and UNICEF, 2012). Poverty can impede children's cognitive and physical development and their ability to learn as a result of poor nutrition, unsafe and unhealthy environments, and the consequences of financial stress. It can contribute to behavioural, social and emotional problems, and poor health. Poverty status can be inferred through housing conditions. Therefore, the information from the Census on the living conditions of the households in which children and youth live gives some insight into the environment in which they are brought up in, and their families' wealth.

A large majority of children and youth live in households in which their dwelling is owned by a member of the household. Throughout the Union, 87.0 per cent of children and 85.0

Chapter 3. Housing, infrastructure, services and assets - the hardware for health
per cent of youth were reported as living in owned housing. Ownership was more prevalent in rural areas, where the proportion was 93.5 per cent for both children and youth (Table 3.1). Two thirds of urban children and youth lived in owned housing (67.1 and 66.2 per cent, respectively) and an additional one fifth lived in rented accommodation (19.5 per cent of urban children and 21.6 per cent of urban youth). Only a small minority of children and youth lived under other forms of housing tenure. Less than 3 per cent of children and youth lived in government housing, and less than 1 per cent in private company quarters. It should be noted that these various proportions are, not surprisingly, broadly similar to those for the population as a whole (see Department of Population, 2017b).

Table 3.1
Percentage of children and youth in conventional households by tenure of dwelling, urban and rural areas, 2014 Census

| Age group/ Area | $\begin{aligned} & \text { Total population } \\ & (=100 \%) \end{aligned}$ | Tenure |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Owner | Renter | Provided free (individual) | Government quarters | Private company quarters | Other |
| 0-14 |  |  |  |  |  |  |  |
| Union | 13,995,368 | 87.0 | 6.5 | 2.5 | 2.6 | 0.7 | 0.6 |
| Urban | 3,440,519 | 67.1 | 19.5 | 4.6 | 6.2 | 1.0 | 1.5 |
| Rural | 10,554,849 | 93.5 | 2.3 | 1.8 | 1.5 | 0.6 | 0.3 |
| 15-24 |  |  |  |  |  |  |  |
| Union | 8,182,858 | 85.0 | 8.5 | 2.3 | 2.8 | 0.8 | 0.7 |
| Urban | 2,531,720 | 66.2 | 21.6 | 4.0 | 5.7 | 1.1 | 1.4 |
| Rural | 5,651,138 | 93.5 | 2.5 | 1.5 | 1.5 | 0.6 | 0.4 |

Table 3.2 (and Appendix 2, Table A2.4) groups the type of housing into three groups: the first group consists of condominiums, apartments or flats, bungalows and brick houses; the second group consists of semi-pacca and wooden houses; and the third group consists of housing units constructed from bamboo, huts, and other types of dwelling units - the latter group considered as being constructed from poor quality materials or impermanent structures that require regular maintenance to be an effective shelter.

## Chapter 3. Housing, infrastructure, services and assets - the hardware for health

Table 3.2
Percentage of children and youth in conventional households by type of housing by tenure, urban and rural areas, 2014 Census

| Area/Type of housing | Total population | Tenure |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Owner | Renter | Provided free (individual) | Government quarters | Private company quarters | Other |

The Census reported that almost half of children (45.6 per cent) and more than a third of youth ( 38.5 per cent) lived in poor quality housing (housing made from bamboo, a hut or other types of dwelling units). This was more common in rural areas, where just over half ( 50.3 per cent) of children and 44.5 per cent of youth did so, compared with just less than

Chapter 3. Housing, infrastructure, services and assets = the hardware for health
a third (31.4 per cent) of urban children and a quarter (25.2 per cent) of urban youth - levels that are still uncomfortably high. This is broadly consistent with the Ministry of Construction's estimate of one third of urban households living in slums (U Khin Mg Thein, 2014). Table 3.2 also shows that higher proportions of youth ( 12.3 per cent) than children ( 8.9 per cent) lived in better quality housing (condominiums, apartments, bungalows, brick houses), and that this was generally the case for all tenure categories except those living in government quarters.

The 'other' category of tenure referred to in Table 3.2 is made up of households without specific rights to their housing. A small proportion of children and youth lived under these circumstances, amounting to 89 thousand children and 55 thousand youth in total. As can be noted from Table 3.1, these numbers are less than 1 per cent of their respective population groups. Though these proportions are small, the children in this group are very disadvantaged because most of the housing units under this type of tenure are made from poorer quality materials ( 73 per cent of households had the lowest housing quality rank, Department of Population 2017b). As can be seen from Table 3.2, the housing units of 82.0 per cent of children that were reported under the 'other' tenure type were classified as housing made from bamboo, a hut, or other types of housing. This proportion was much higher than that of youth ( 75.3 per cent).

In Myanmar's rural households, roofing material has been found to be a sensitive indicator of chronic poverty (IHLCA Project Technical Unit, 2011). This is possibly because it is easier for a household to upgrade their dwelling's roofing material than its walls, when money becomes available. Table 3.3 shows the proportion of children and youth by type of housing and type of roofing material (see also Appendix 2, Table A2.5). Almost all (99 per cent) of children who were reported as living in condominiums/apartments/bungalows/brick houses had durable roofs, but for 62.4 per cent of children living in housing made from bamboo, a hut, or other types of housing the roofing was made from dhani, theke, leaf or bamboo; materials which require more regular maintenance.

While the types of materials used to construct houses are probably related to health, there is no evidence that some types of construction materials for walls, roofs and floors are a direct cause of ill-health. This may be because other factors such as climate, construction methods and maintenance affect dampness and air ventilation. However, construction material may nevertheless have some effects on health through its association with wealth or poverty (Bradley and Putnick, 2012).

## Chapter 3. Housing, infrastructure, services and assets = the hardware for health

Chapter 3. Housing, infrastructure, services and assets = the hardware for health

### 3.2 Infrastructure for health

The 2014 Census collected information on the fuel used for cooking, the energy source for lighting, the source of drinking water and the type of toilet (see Appendix 1). There is robust evidence that the quality of these amenities have a profound effect on health, especially that of young children who spend large amounts of time inside the home and who are particularly susceptible to diseases from contaminated water, exposure to human excrement and indoor air pollution (Bradley and Putnick 2012). Diarrhoeal and respiratory illnesses are the main causes of death of children under five in Myanmar (MNPED and UNICEF, 2012).

A World Bank assessment of poverty in Myanmar published in 2014 noted that access to electricity, water and sanitation was probably low in rural areas, but that the data then available was inadequate to form a complete picture (World Bank, 2014). A recommendation was that improving data sources was a priority. The 2014 Census provides the much-needed data and confirms concerns about the lack of such infrastructure.

Young children are particularly susceptible to diarrhoeal and respiratory diseases and injuries resulting from an unhealthy or unsafe domestic environment. For this reason, this section mainly presents information on children's conditions in the household, although the supporting data in Appendix 2, Tables A2.5-A2.9 also provide comparable information for the youth population.

### 3.2.1 Cooking fuel

Over 85 per cent of children aged 0-14 in Myanmar live in a household that uses firewood or other solid fuels for cooking (Figure 3.1). These fuels emit large quantities of health-damaging particulate matter and climate warming pollutants (such as black carbon) into the household environment, increasing the risk of respiratory illnesses, including childhood pneumonia and chronic obstructive pulmonary disease, cardiovascular disease, and lung cancer (Bruce et al, 2000; WHO, 2014).

The use of these fuels is far more prevalent, indeed, almost universal, in rural areas - around 94 per cent of rural children live in households using solid fuels compared to 61 per cent of urban children. Figure 3.1 shows that firewood was the single most commonly used fuel in rural areas, where 87.5 per cent of children were reported as living in households using such fuel, compared to just less than a third ( 31.5 per cent) in urban areas, where, instead, electricity was the more common source of energy for cooking ( 36.9 per cent). Less than 5 per cent of rural children lived in households that used this cleaner source of energy for cooking. (See Appendix 2, Table A2.6 for the percentage use of the full set of solid and other fuels identified in the 2014 Census).

Chapter 3. Housing, infrastructure, services and assets - the hardware for health

Figure 3.1
Percentage of children aged 0-14 in conventional households by main type of fuel for cooking, urban and rural areas, 2014 Census

Note: 'Other' includes liquefied petroleum gas (LPG), kerosene, biogas and the residual 'other' category in the 2014 Census question on cooking fuels (see Appendix 1).

### 3.2.2 Main source of lighting

A picture of the striking difference in the exposure of children to different sources of energy for lighting is shown at Figure 3.2. The most common source of lighting in urban households is electricity; 71.4 per cent of urban children were reported as living in a household that had lighting powered by electricity. In rural areas, by comparison, the proportion of children was only 13.1 per cent. Some households have to create their own source of electricity through a private generator, water mill or with a solar energy system. Rural children were much more likely to live in households that employed these methods than children in urban households. Battery power is another lighting source that rural children rely on much more than their urban counterparts.

Chapter 3. Housing, infrastructure, services and assets = the hardware for health

Figure 3.2
Percentage of children aged 0-14 in conventional households by main type of energy for lighting, urban and rural areas, 2014 Census

Candle power provides the most common type of lighting for rural children; 26.9 per cent of rural children lived in households using candles for lighting compared to 8.9 per cent of urban children. A further 12.1 per cent of rural children lived in households using kerosene compared with less than 1 per cent of children in urban households. Both kerosene and candles cause air pollution, which is a health risk for young children and women who stay inside the house. Poisoning due to children ingesting kerosene, or accidents and death as a result of fires from candles or kerosene lamps, are ever-present dangers (Mills, 2014). A detailed table, showing the type of lighting children and youth have in their households by age group and urban/rural areas, is presented at Appendix 2, Table A2.7.

### 3.2.3 Main source of drinking water

The 2014 Census recorded (separately) households' main sources of water for drinking and other purposes. Only the sources of drinking water are examined here. But before looking at the results in detail, it should be noted that the Census data can only give a partial view of the source and quality of drinking water. Firstly, the Census did not record where the household's water source was located. The MICS (2009-2010) found that only 24 per cent of rural households had their water source on their premises; the remaining 76 per cent had to fetch water (MNPED and UNICEF, 2012). The majority (64 per cent) of urban households, however, had water on their premises. Children rarely fetched water and very few households reported having to spend more than one hour for a round trip to fetch water. Secondly, the Census only recorded the main source of drinking water, and thus required only a single response to the question (see Q35 at Appendix 1). If a household used two sources, such as a tube well and bottled water, enumerators were instructed to probe for the source used most often. Thirdly, an improved source does not guarantee that householders are drinking uncontaminated water. Piped water is not necessarily safe for drinking, and water storage

Chapter 3. Housing, infrastructure, services and assets = the hardware for health
and handling practices can contaminate water. The Census did not record if households boiled or otherwise treated their water.

In Myanmar, the classification of improved and unimproved sources of water differs from international conventions. The WHO/UNICEF Joint Monitoring Programme for Water and Sanitation has developed a clean water 'ladder' distinguishing between improved and unimproved sources of drinking water (Department of Population, 2017b). In that classification, reliance on bottled water is considered as 'unimproved', the argument being that bottled water is relatively expensive and, in many countries, the quality of water is not regulated. However, in urban areas of Myanmar, bottled water is commonly used as a practical source of reliable drinking water, since it is relatively inexpensive and widely available through robust supply chains. Water is stored in large plastic containers that people take to a water vendor to refill when empty. Such bottles are used in many households, offices, worksites and even in the fields. Therefore, in the Myanmar context, this report classifies bottled water as an 'improved' source even though its quality cannot always be assured.

With these limitations in mind, the Census still provides a good description of the most common sources of drinking water in Myanmar. Of the sources identified in the questionnaire, those that are regarded as 'improved' include bottled water, tap or piped water, tube well or borehole, and protected spring, while other sources (an unprotected well or spring, a pool, pond or lake, a river, stream or canal, waterfall or rainwater, or water from a tanker or truck, or from other sources) are regarded as 'unimproved'. Table 3.4 shows that 84.9 per cent of urban children were living in households with access to an improved source of drinking water. In rural areas, less than 60 per cent of children had access to an improved source of drinking water. For youth, the respective percentages were a little higher.

Table 3.4
Percentage of children and youth living in conventional households by access to improved sources of drinking water, urban and rural areas, 2014 Census

| Age group | Union |  | Urban |  | Rural |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
|  | With access | Without access | With access | Without access | With access | Without access |
| Children $0-14$ | 65.6 | 34.4 | 84.9 | 15.1 | 59.4 | 40.6 |
| Youth $15-24$ | 69.9 | 30.1 | 87.7 | 12.3 | 61.9 | 38.1 |
| Population $25+$ | 71.4 | 28.6 | 87.8 | 12.2 | 64.1 | 35.9 |
| Total population | $\mathbf{6 9 . 4}$ | $\mathbf{3 0 . 6}$ | $\mathbf{8 7 . 1}$ | $\mathbf{1 2 . 9}$ | $\mathbf{6 2 . 3}$ | $\mathbf{3 7 . 7}$ |

Note: The percentage of households recording 'other' source of drinking water is not shown. This equates to about 2 per cent.

The type of water source to which urban and rural households have access is also very different. As Figure 3.3 shows, approximately the same proportion of rural and urban children used water from a tube well or borehole, but a protected well or spring water was a more common source for rural children, while piped water to a tap was a more common source for urban children. The biggest difference is that 27.1 per cent of urban children lived in households using bottled water, whereas very few rural children had regular access to such a source of water. Appendix 2, Table A2.8 gives the percentages of urban and rural children and youth for each type of water source.

Chapter 3. Housing, infrastructure, services and assets - the hardware for health

Figure 3.3
Percentage of children aged 0-14 in conventional households, by type of improved sources of drinking water, urban and rural areas, 2014 Census

### 3.2.4 Type of toilet

Sanitation is an important factor when considering health conditions. Household access to improved sanitation brings health benefits to its members and the wider community. In addition, the privacy that comes with having an improved toilet is an important issue for the security of children and youth, especially girls. Improving access to improved sanitation was a Millennium Development Goal, and the Sustainable Development Goals call for universal access.

For every conventional household, the 2014 Census recorded the type of toilet used. The response options were: flush, water seal (improved pit latrine), pit (traditional pit latrine), bucket (surface latrine), other, and none (see Appendix 1). Using this classification, 'improved sanitation' was defined as being either flush or water seal, while responses of pit, bucket, and none were classified as 'unimproved sanitation'. This classification is consistent with international standards. About 1 per cent of children lived in a household with a toilet recorded as 'other' (less than 0.5 per cent in urban areas and 1.2 per cent in rural areas). However, for the analysis in this report the category 'other' has not been included in either the improved or unimproved classification. As Table 3.5 shows, at least 90 per cent of urban children and youth had access to improved sanitation. Only 62 per cent of rural children and 68 per cent of rural youth had such access.

Chapter 3. Housing, infrastructure, services and assets = the hardware for health

## Table 3.5

Percentage of children and youth in conventional households with access to improved sanitation, urban and rural areas, 2014 Census

| Age group | Union |  | Urban |  | Rural |  |
| :--- | :--- | :--- | ---: | ---: | ---: | ---: |
|  | With access <br> to improved <br> sanitation | Without access <br> to improved <br> sanitation | With access <br> to improved <br> sanitation | Without access <br> to improved <br> sanitation | With access <br> to improved <br> sanitation | Without access <br> to improved <br> sanitation |
| Total Population | $\mathbf{7 4 . 5}$ | $\mathbf{2 5 . 5}$ | $\mathbf{9 2 . 5}$ | $\mathbf{7 . 5}$ | $\mathbf{6 7 . 2}$ | $\mathbf{3 2 . 8}$ |
| Children 0-14 | 69.3 | 30.7 | 90.2 | 9.8 | 62.5 | 37.5 |
| Youth $15-24$ | 75.3 | 24.7 | 92.7 | 7.3 | 67.5 | 32.5 |

Figure 3.4 shows that the water seal/improved pit latrine was the most common type of toilet for children in both urban and rural areas ( 86.5 per cent and 61.7 per cent, respectively). A small proportion of urban children were reported as living in a household with a flush toilet (3.7 per cent) but the proportion was even lower in rural areas (less than 1 per cent). Rural children are more than twice as likely to have access to a traditional pit latrine ( 10.5 per cent) than urban children ( 4.6 per cent). The biggest differential was that more than one in five rural children ( 22.0 per cent) had no access to any type of toilet whatsoever, while only 3.4 per cent of urban children were similarly deprived. Full details of the type of toilet for both children and youth are presented in Appendix 2, Table A2.9.

Figure 3.4
Percentage of children aged 0-14 in conventional households by type of toilet accessible to their households, urban and rural areas, 2014 Census

As with the indicator for source of drinking water, information on the type of toilet should be interpreted with caution. The question referred to the type of toilet 'used' by the household but did not enquire into the location of the amenity, or whether or not it was shared with other households. Shared toilets (whatever their type) are not considered to be 'improved', according to the WHO/UNICEF definition. Also, in some parts of the country, not all latrines that use water are actually water sealed (MNPED and UNICEF, 2012). The Census results may, therefore, overestimate the number of children who live in a house with access to 'improved sanitation' as defined internationally.

Chapter 3. Housing, infrastructure, services and assets = the hardware for health

### 3.2.5 Summary of the healthiness of households

The amenities discussed above describe the housing conditions in which children and youth live. They can be combined in a way that provides strong evidence supporting a link between the domestic environment and health. As the youngest children are most at risk from the injurious effects of infectious diseases caused by unhealthy domestic environments, the data is presented below for children aged $0-4$. These measures do not, however, give a complete picture of health risks to children in the household. In particular, the Census did not measure overcrowding. Information was collected on household size but not on the size of the dwelling or the number of rooms available to the household.

The health risk factors captured in the Census are: unimproved sources of drinking water and unimproved sanitation; use of solid fuels for cooking; and fuel-based lighting. The index is simply the number of these health risks that are present for each child or youth, with a score ranging from 0 indicating no health risks present to 4, representing all four health risks.

As Figure 3.5 shows, more than one-third of young urban children were reported as living in a household with none of the health risks, while two-fifths were exposed to only one health risk. In stark contrast, only 4 per cent of young children in rural areas had no health risk, and more than two thirds were exposed to two or more health risks.

Figure 3.5
Percentage of children aged 0-4 in conventional households by exposure to health risks, urban and rural areas, 2014 Census

The mean number of health risks in the domestic environment is shown for each State/ Region by urban and rural area at Figure 3.6. From the information collected in the Census, rural young children had, in different States/Regions, a range of 1.6 to 3.3 health risks in their household (with an average score of 2.1). The outlier is rural Rakhine (3.3) though this figure is likely to undervalue the true health risk score since it tended to be those areas with much poorer quality housing - and, therefore, with a greater number of health risks - that were not enumerated in the Census. Though there is generally a lower risk to health in urban areas (where the average score is 1.0) there is greater variation across States/Regions, with the average number of health risks ranging from 0.6 in Nay Pyi Taw to 2.1 in urban Rakhine. The

Chapter 3. Housing, infrastructure, services and assets = the hardware for health
detailed data by State/Region, including the proportions with unsafe or unhealthy sources of lighting, cooking fuel, sanitation and drinking water are presented in Appendix 2, Table A2.10.

Figure 3.6
Mean number of health risks in households with children aged 0-4, urban and rural areas, State/
Region, 2014 Census

There is, of course, a close link between the quality of housing and the number of health risks. Figure 3.7 shows that nearly 90 per cent of young children (aged 0-4) living in condominiums/ apartments/bungalows/brick houses had one or no health risks in their household. Half of children living in semi-pacca/wooden houses had no more than one health risk, but less than 30 per cent of children in houses made from bamboo, a hut, or in other types of housing units enjoyed as equally a healthy environment.

In rural areas, even housing units built with better quality materials can lack infrastructure such as electricity, access to improved water sources, improved sanitation, and the use of fuel that is not harmful to health that would otherwise reduce young children's risk of disease. Table 3.6 shows that at least a quarter of rural households with children aged 0-4 living in condominiums/apartments/bungalows/brick houses are exposed to two or more health risks compared with 4.3 per cent of urban households living in the same types of housing.

Chapter 3. Housing, infrastructure, services and assets = the hardware for health

### 3.3 Connectivity

For Myanmar to achieve its goal of economic growth for greater prosperity, its children and youth need to be connected to the wider world. Firstly, they need a safe and reliable means of getting to and from school. For some, that will mean walking, but many children and youth, especially in rural areas, live a long way from primary and secondary schools. Youth also need transport for ready access to employment opportunities and markets. Secondly, to take their place in the outside world, children and youth need to transcend distance to learn about local, national and international events. They also need to form and communicate their opinions, find out about work opportunities and stay in touch with family and friends. The 2014 Census provided some indicators of youth connectivity through information on transport assets, televisions and radios, telephones and whether the internet was available to the household.

### 3.3.1 Transport

Transport infrastructures are poor in Myanmar. It has the second lowest road density (kilometres of road per 1,000 square kilometres) among ASEAN countries (World Bank, 2014). In rural areas, the roads that do exist are of poor quality and are often not passable in bad weather. The largest cities of Yangon and Mandalay regularly experience very high traffic congestion.

Coupled with poor infrastructures, many households have the additional disadvantage of having no available transport means, lacking even a bicycle or motorcycle for travel to school, work and markets. Table 3.7 shows that, at the Union level, a slightly smaller proportion of children were living in households with access to a bicycle ( 36.8 per cent) compared with youth ( 40.4 per cent). In urban areas, just more than a half of both children and youth had access to a bicycle at their house, while in rural areas less than a third of children had such access. In total, 42 per cent of children and 35 per cent of youth live in a household without access to either a bicycle or a motorcycle. Being without any mode of transport is more common in rural areas than in urban areas. Details on the availability of all modes of transport by age group are presented in Appendix 2, Table A2.11.

Chapter 3. Housing, infrastructure, services and assets = the hardware for health

## Table 3.7

Percentage of children and youth in households by mode of transport available to household, urban and rural areas, 2014 Census

| 15-24 | 5,651,138 | 35.2 | 45.9 | 38.2 | 1.7 | 33.4 | 3.9 | 5.9 | 3.6 |

### 3.3.2 Communication assets

Based on the 2014 Census, access to a television is more common than access to a radio among households with children and youth. Just less than half of children ( 47.9 per cent) and just over half of youth ( 54.9 per cent) were reported as living in households with access to a television (Table 3.8). Urban children ( 74.9 per cent) and youth ( 78.4 per cent) are almost twice as likely to have a television in their house as those living in rural areas (39.1 per cent and 44.4 per cent, respectively). There is international evidence that having a television in the house is beneficial for children's learning, reinforcing reading and comprehension lessons received at school.

In urban areas, only a quarter of children and youth live in a household with a radio (24.5 per cent of children and 27.1 per cent of youth). In rural households, radios are, however, more common though still not as prevalent as televisions. Here, over a third of children ( 34.3 per cent) and 40.1 per cent of youth have access to a radio. Nevertheless, one-fifth of urban children and two-fifths of rural children live in a household with neither a radio nor a television (Figure 3.8).

Table 3.8
Percentage of children and youth living in a household with or without a television or radio, urban and rural areas, 2014 Census

| 15-24 | 5,651,138 | 44.4 | 40.1 | 35.5 |

Chapter 3. Housing, infrastructure, services and assets = the hardware for health

The means to communicate with the wider outside world assists households to take advantage of economic opportunities. The wide penetration of mobile phones, at least in urban areas, at the time of the 2014 Census shows that many households are able to take advantage of new ways to stay in touch with employers and markets, in addition to family and friends. The relatively high ownership of televisions is also a positive finding.

In 2014, mobile phones had significantly penetrated urban households, with two thirds (67.2 per cent) of youth living in a house with at least one mobile phone. Children in urban households were not far behind; 58.1 per cent lived in a household with a mobile phone. However, overall, less than one in five children (18.4 per cent) and one quarter ( 24.9 per cent) of rural youth lived in a household with a mobile phone (Appendix 2, Table A2.12).

Figure 3.8
Percentage of children and youth living in a household without access to a television or radio, urban and rural areas, 2014 Census

Although mobile phone coverage was high in urban areas, Figure 3.9 shows that having a computer and access to the internet at home was far less common for children and youth, particularly in rural areas, where barely 1 per cent of youth and less than 1 per cent of children had access to a computer, compared to 12.3 per cent and 7.8 per cent of urban youth and children, respectively.

Chapter 3. Housing, infrastructure, services and assets = the hardware for health

Figure 3.9
Percentage of children and youth living in a household with access to a computer and internet, urban and rural areas, 2014 Census

### 3.4 Summary

The 2014 Census shows that between a quarter and a half of children and youth lived in households lacking the basic requirements for good health and prosperity. Among the findings presented in this chapter are:

- 45.6 per cent of children and 38.5 per cent of youth live in poor quality housing that requires frequent maintenance.
- 41 per cent of rural children and 15 per cent of urban children do not have access to an improved source of drinking water.
- 38 per cent of rural children and 10 per cent of urban children live in a household without access to improved sanitation, and 22 per cent of rural children and 18 per cent of rural youth have no access to any form of toilet.
- 94 per cent of rural children aged 0-4 live in a house using solid fuels or kerosene for cooking, as a result of which, more than two thirds ( 68.6 per cent) of rural children and one fifth ( 23.4 per cent) of urban children live with two or more health risks in their domestic environment.
- 42 per cent of children and 35 per cent of youth do not have access to a bicycle or motorcycle/moped/tuk tuk.
- 37 per cent of children and 30 per cent of youth have no access to a radio or a television.

Despite the evidence of widespread poverty, there are also many promising findings. The majority of children and youth in urban areas live in a safe and healthy environment. By 2014, mobile phones were penetrating ordinary households in rural as well as urban areas. Youth live in more favourable circumstances than children, possibly suggesting that as their parents' age they have been able to acquire more wealth to invest in housing, improve services and acquire assets.

## Chapter 4. Living arrangements of children and youth

Whereas Chapter 3 considered the physical aspects of domestic life, to the extent possible from the information collected in the Census, this chapter discusses the people with whom children and youth live. The principal questions are whether or not children are living with at least one parent, and whether or not youth have made the transition to living independently. The final section in this chapter explores the broad economic position of the households in which children and youth live as assessed by a wealth index using information on the characteristics of housing and households collected in the Census.

The 2014 Census enumerated people living in conventional households and institutions. A conventional household was defined in the field manual for enumerators as:

One or more persons who usually share their living quarters (single quarter or compound) and share their meals. In common usage it might be said that a household consists of 'all persons living and eating together or eating from the same cooking pot'. They may be residing in several structures within a compound as in rural areas.

The term 'family' does not have the same meaning as 'household' in this Census. A family consists of all persons related by blood or marriage whether or not they live miles apart. To be members of the same household, all persons must live and eat together as defined above. A household might be a family, a group of unrelated people living together, or a single person living alone. In some cases one family living in the same dwelling might be considered as two households (Depertment of Population, 2014b, pp. 4-5).

The instructions defined the head of household for each conventional household as one person who "generally undertakes key decisions and who is recognized as such by all household members". Every household member is described by their relationship to the head, such as a spouse, child, sibling, other relative or non-relative.
'Institutions’ are defined as groups of people who live together but were not living as a conventional household with a head and other members who could be described in relation to that head. The main types of institutions enumerated in the Census were old-people's homes; orphanages; hospitals; boarding schools; hotels, hostels and inns; institutions for persons with disabilities; prisons; monasteries; convents; military and police barracks; and camps for workers. Homeless people and persons living in other collective quarters were also enumerated through the institution questionnaire.

### 4.1 Living arrangements of children in conventional households

Nearly 14 million children were enumerated in conventional households. Figure 4.1 shows the distribution of children by their relationship to the head of the household in urban and rural areas. Three quarters of children ( 73.7 per cent) lived in households headed by a parent, and most of the remaining children (another 21.0 per cent) lived in households headed by a grandparent. The proportion with a grandparent was higher in urban areas ( 25.9 per cent) than in rural areas (19.3 per cent), possibly reflecting the more limited availability of housing in cities. Older children are more likely to live in a household headed by their parent. This is

Chapter 4. Living arrangements of children and youth
because older children have, on average, older parents who will have acquired more resources, enabling them to establish their own residence, and whose own parents (grandparents of children) are more likely to have died.

The Census reported that only 5.2 per cent of children aged 0-14 lived in households headed by someone other than a parent or grandparent; but living arrangements varied between urban and rural areas and by the age of the child. The percentage of children living in a household headed by another relative (that is, not a grandparent or sibling) or a non-relative, increased with age from 3.9 per cent of $0-4$ year olds to 5.8 per cent of 10-14 year olds. (A detailed breakdown of children's relationship to the household head by age and urban and rural areas is given in Appendix 2, Table A2.13). The proportions of such children were twice as high in urban areas: among all urban children 8.1 per cent were living in these types of households compared to 3.6 per cent of rural children. More than one out of 10 urban children aged 10-14 were living in a household headed by someone other than a parent or grandparent. For all age groups and in both urban and rural areas, living with a household head who is another relative was more common than living with non-relatives.

Figure 4.1
Percentage of children in conventional households by relationship to the head of household by age group, urban and rural areas, 2014 Census

Note: Son/daughter category includes adoptive child and son/daughter-in-law. Grandchild includes greatgrandchild.

A factor of great importance for the protection of children is the number and proportion of children who are not living with their parents. The 2014 Census was not specifically designed to answer this question directly. Household members were only described in terms of their relationship to the household head. Thus, a child's parent could have been living in a household in which a grandparent was designated as head. Myanmar culture regards elders as the head if they are present in the household. In such a case the relationship between a child and its parent would not have been specifically identified.

## Chapter 4. Living arrangements of children and youth

However, the number of children living with a parent (regardless of the designated head) can be approximated by looking in detail at the household composition of households headed by a child's grandparent or sibling. If a household headed by a grandparent also had one or more members described as a son/daughter or son/daughter-in-law it can be assumed that the child was living with his or her parent, although it is possible that the child was living with an aunt or uncle. For households headed by a sibling, if there was a household member who was a parent to the head of household that person would also be the child's parent. It was not, however, possible to identify probable parents in households headed by another relative or a non-relative.

At the Union level, Table 4.1 shows that 73.7 per cent of children aged 0-14 in the country live in a household headed by a parent. Adding households headed by a grandparent or sibling with someone from the parental generation who is also a resident, brings the approximate percentage of children living with their parents up to 93.1 per cent: this is slightly lower in urban areas ( 89.6 per cent) and higher in rural areas ( 94.2 per cent). The reason for the difference is the higher proportion of households headed by another relative or a non-relative in urban areas. It is, however, not possible to determine, from an analysis solely of the Census data, what proportion of these households include the child's parent.

Approximately, over half a million children were living in households headed by 'other relative' or non-relative. This is equivalent to 4.7 per cent of the total number of children and is broadly consistent with the results of the national MICS survey, which found that about 5 per cent of children were not living with their biological parents (MNPED, MOH, and UNICEF, 2011).

## Table 4.1

Estimated number of children aged 0-14 in conventional households living with a parent, urban and rural areas, 2014 Census

Table 4.2 presents these estimates of children with and without their parents for the States/ Regions ranked in the order of the proportion of children living with their parents. Chin State has the highest estimated proportion of children who are living with their parents ( 96.1 per

## Chapter 4. Living arrangements of children and youth

cent), while the lowest percentages are in Yangon, Tanintharyi, Kayin and Mon (each under 91 per cent). In almost all cases, the vast majority of 'unclassifiable' households were those headed by 'other relatives'. Only in Yangon were more than 2 per cent of children reported as living in a household headed by a non-relative.

## Table 4.2

Estimated percentage of children aged 0-14 in conventional households living with or without a parent, ranked by percentage living with parents, State/Region, 2014 Census

| State/Region | Living with <br> parents | Living without <br> parents | Other <br> relative | Non-relative | Total |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Chin | 96.1 | 1.4 | 2.1 | 0.4 | 100 |
| Kayah | 95.2 | 1.3 | 2.9 | 0.7 | 100 |
| Rakhine | 95.1 | 1.7 | 2.6 | 0.5 | 100 |
| Magway | 94.6 | 1.9 | 2.8 | 0.7 | 100 |
| Nay Pyi Taw | 94.2 | 1.6 | 3.1 | 1.0 | 100 |
| Sagaing | 94.2 | 1.7 | 3.3 | 0.8 | 100 |
| Ayeyawady | 94.1 | 2.1 | 3.0 | 0.8 | 100 |
| Shan | 94.1 | 1.8 | 3.2 | 0.9 | 100 |
| Bago | 93.3 | 2.4 | 3.5 | 0.8 | 100 |
| Mandalay | 91.4 | 1.7 | 3.6 | 1.4 | 100 |
| Kachin | 90.9 | 2.2 | 5.3 | 1.1 | 100 |
| Yangon | 90.9 | 1.7 | 5.3 | 2.1 | 100 |
| Tanintharyi | 90.1 | 3.8 | 4.2 | 1.1 | 100 |
| Kayin | 88.6 | 5.1 | 4.1 | 0.7 | 100 |
| Mon | 5.9 | 4.6 | 0.9 | 100 |  |

Note: Children with parents include: children who are the son/daughter or adopted child of the head of household; the grandchild of the head with a son or daughter or son/daughter-in-law also living in the house; or a sibling of the head of household with a parent also living in the household. Children not living with a parent are a head or spouse of head, or live with a grandparent or sibling as head without someone who could be a parent.

Table 4.3

| Mandalay | Yame`Thin | 95.4 | Tanintharyi | Dawei | 87.4 |
| Magway | Thayet | 95.3 | Mon | Mawlamyine | 87.4 |
| Shan | Kunlon | 95.3 | Yangon | West Yangon | 85.3 |

Chapter 4. Living arrangements of children and youth

Appendix 2, Table A2.14 provides the same details as at Table 4.2 for all Districts. From these data, the ten Districts with the highest and lowest percentages of children living with a parent are identified and shown at Table 4.3.

There are three main reasons for a child to be living without a parent. One is that the parents have died and the child is an orphan, living on his or her own or being looked after by a relative. Secondly, one or both parents are alive but are not living with the child for work or other reasons. Thirdly, the child has left the parental home for educational purposes or to pursue employment opportunities. These reasons will be explored in detail in Chapter 6, which describes the schooling and employment of children, and in Chapter 9 on migration.

The Census cannot give any insight about the quality of care that children living apart from a parent receive. However, it can be noted that States/Regions with the lowest percentages of children living with a parent are in areas with high in-migration (Yangon, Mandalay, Kachin, and Kayin) or international emigration (Mon, Kayin and Tanintharyi) (Department of Population, 2017a). A threshold of about 4 or 5 per cent of children living apart from a parent or in a household not headed by a parent or a grandparent suggests that there are some factors that prevail across most parts of the country, including the death or incapacitation of parents or the need for children to move for education.

### 4.2 Children in institutions

Some 2.3 million people ( 4.7 per cent of the Myanmar population) were living in institutions at the time of the 2014 Census (Department of Population, 2015). As Figure 4.2 shows, this proportion varied by age. For all but the youngest of children, the proportion was much higher for males. Since work camps, monasteries, prisons and military and police barracks comprise many of the institutions, this selectivity towards males is understandable for youth and adults. However, it is also true for older children. The 2014 Census counted 404,201 children (aged 0-14) living in institutions, with almost three times as many boys than girls. This disparity has been noted before: a national survey of 174 registered residential facilities found more than three times as many boys than girls (Myanmar Survey Research, 2011).

Figure 4.2
Percentage of persons in institutions by age by sex, 2014 Census

Chapter 4. Living arrangements of children and youth

Young children aged 0-4 had the lowest proportion of those living in an institution. The 2014 Census enumerated 59,278 young children living in institutions, representing 1.3 per cent of all young children (Appendix 2, Table A2.15a). There were slightly more boys $(30,612)$ than girls $(28,666)$, representing 1.4 per cent and 1.3 per cent of all young children respectively. This figure is a benchmark for further efforts to reduce the number of children aged 0-3 in institutions to zero, which is the goal of the Myanmar Policy for Early Childhood Care and Development (Department of Population, 2014c). (Appendix 2, Table A2.15b gives the number and percentages of all children (aged 0-14) living in institutions at the District level).

There are many reasons why a child would be in an institution. Types of institutions are diverse, ranging from hospitals to orphanages and other residential care facilities for children with specific needs. Religious centres house both children and youth who are long-term residents, studying the public school curriculum, and those receiving short-term religious instruction. Other institutions include places of learning, employment or a combination of both. It is possible that some children are living with their parents within some institutions such as a work camp. Other children may be homeless. The institutional questionnaire did not record if children were attending school, but the main activity of children aged 10 and over was recorded in the questionnaires for both conventional households and institutions. Table 4.4 shows that children in institutions were much less likely to be described as fulltime students ( 43.4 per cent) than children in conventional households ( 78.5 per cent). More than half of boys aged 10-14 and one in five of girls in institutions were described as 'other', whereas only about one in ten were so described in conventional households.

Chapter 4. Living arrangements of children and youth

| Contributing family worker | 0.7 | 0.5 | 0.9 | 4.9 | 0.9 | 6.4 |
| Sought work | 0.1 | 0.1 | 0.1 | 2.0 | 1.6 | 2.1 |
| Full-time student | 39.0 | 39.0 | 39.0 | 78.9 | 84.6 | 76.9 |
| Other | 51.6 | 51.0 | 52.0 | 7.9 | 7.0 | 8.2 |
| Female |  |  |  |  |  |  |
| Total ( $=100 \%$ ) | 49,885 | 23,063 | 26,822 | 2,462,728 | 629,424 | 1,833,304 |
| Employee | 15.8 | 12.4 | 18.6 | 5.3 | 4.6 | 3.6 |
| Own account worker | 1.3 | 1.1 | 1.5 | 1.6 | 0.7 | 1.9 |
| Contributing family worker | 2.1 | 0.8 | 3.1 | 4.7 | 0.8 | 6.0 |
| Sought work | 0.2 | 0.1 | 0.3 | 1.2 | 0.7 | 1.4 |
| Full-time student | 61.2 | 61.5 | 61.0 | 78.0 | 84.7 | 75.7 |
| Other | 19.4 | 24.0 | 15.5 | 10.8 | 9.2 | 11.4 |

Table 4.5 shows the number and proportion of children in institutions by State/Region ranked by the share of the Union population. However, because of the wide range of types of institutions, attracting different proportions of children of different ages, focusing on the number of young children aged 0-4 is more relevant for policy. (As noted above, this information is given by State/Region and District in Appendix 2, Table A2.15a). By far the largest number of young children in institutions was in Kachin State, where 13,536 children, or nearly 9 per cent of all young children in Kachin, were living in an institution. Almost a quarter of all young children in institutions live in Kachin, the most northern State of Myanmar.

There, institutions include camps for persons who have been displaced as a result of conflict, but it was not possible to specifically identify these from the Census. These children were mainly concentrated in Mohnyin District, where 7,494 young children were reported as living in institutions, comprising 13.1 per cent of all young children in that District. Myitkyina and Bhamo Districts also had particularly large numbers of young children living in institutions ( 3,325 and 2,611; comprising 6.2 per cent and 7.8 per cent of all young children in those Districts respectively). A large number of children lived in institutions in Sagaing Region;

Chapter 4. Living arrangements of children and youth
in most of its Districts the percentage of all young children in institutions was at, or below, the Union average of 1.3 per cent, but in the District of Hkamti along the northern border with India there were 4,937 young children living in institutions, representing 9.5 per cent of all young children in the District. Nay Pyi Taw also reported a disproportionately large population of young children living in institutions, mostly located in Dekkhina District where a level of 4.5 per cent of all young children was reported.

Table 4.5
Number of children aged 0-14 living in institutions by sex, and percentage living in institutions, State/Region ranked by share of total population in institution, 2014 Census

| UNION | Both sexes | Male | Female | $\mathbf{1 0 0}$ |  |
| Shan | $\mathbf{4 0 4 , 2 0 1}$ | $\mathbf{2 9 6 , 1 6 8}$ | $\mathbf{1 0 8 , 0 3 3}$ | $\mathbf{2 . 8}$ | 19.8 |
| Mandalay | 59,913 | 66,096 | 13,817 | 4.3 | 13.6 |
| Sagaing | 48,586 | 33,796 | 14,790 | 3.4 | 12.0 |
| Yangon | 47,919 | 32,120 | 15,799 | 2.2 | 11.9 |
| Kachin | 41,377 | 22,741 | 18,636 | 8.8 | 10.2 |
| Ayeyawady | 25,459 | 19,141 | 6,318 | 1.4 | 6.3 |
| Magway | 23,650 | 17,545 | 6,105 | 2.2 | 5.9 |
| Mon | 20,341 | 14,443 | 5,898 | 3.2 | 5.0 |
| Bago | 19,477 | 15,753 | 3,724 | 1.4 | 4.8 |
| Nay Pyi Taw | 12,518 | 8,102 | 4,416 | 3.8 | 3.1 |
| Rakhine | 10,496 | 8,168 | 2,328 | 1.6 | 2.6 |
| Kayin | 8,778 | 6,946 | 1,832 | 1.6 | 2.2 |
| Tanintharyi | 7,374 | 5,363 | 2,011 | 1.5 | 1.8 |
| Kayah | 1,843 | 1,259 | 584 | 1.9 | 0.5 |
| Chin | 1,428 | 864 | 564 | 0.7 | 0.4 |

One factor driving these high rates may be the outmigration of parents in border regions. Another very important factor is that many of these young children live with a parent in a work camp. Yet another explanation for the high rates in particular Districts could be the presence of an institution which attracts children in need of care from surrounding Districts both within and beyond the State/Region boundary. Without an in-depth understanding of their localities it is difficult to determine the specific reasons for children living in institutions.

### 4.3 Living arrangements of youth

Most young people leave their parental home to undertake further study, to work or seek work, or to join a new household following marriage. The age when youth leave their parents' home depends on a number of factors including the education and employment opportunities where they live and the availability of other affordable housing. For some youth, their employment comes with a place to stay within an institution such as a work camp or hostel. Others may attend boarding school or live in student accommodation. To describe the transitions to adulthood, data in this section will be given for young people from age 10-29 by five-year age groups together with a subtotal for 15-24 year olds.

Chapter 4. Living arrangements of children and youth

### 4.3.1 Youth in conventional households

Some 8.2 million youth (or 91 per cent of the 9.0 million aged $15-24$ in the Union) live in conventional households. As with children, the investigation into the living arrangements of youth starts with their relationship to the head of household. Also, as with children, male and female youth have similar living arrangements. Figure 4.3 highlights the difference in the relationship to the head of household between urban and rural young people. Detailed information of youth's relationship to the head of household by sex, age and urban-rural area is given in Appendix 2, Table A2.16.

Figure 4.3
Percentage of youth in conventional households by relationship to the head of household by age, urban and rural areas, 2014 Census

Becoming the head of a household (or becoming the spouse of a head) is more common among rural youth than among urban youth. One in five rural youth aged 20-24 were reported to be the head of a household (or the spouse of one) compared to just one in seven among their urban peers. This is partly due to a younger age at marriage in rural areas and probably also facilitated by easier access to space for separate cooking and eating areas thus creating separate households. Chapter 8 will explore the living arrangements of young married people.

The other major difference between urban and rural areas is the larger proportion of youth aged 15-19 and 20-24 living with other relatives and non-relatives. Such household arrangements account for around a fifth of urban youth in these age groups compared with around just 6 per cent in rural households. However, living in different household composition types does not mean that youth are living in smaller households. As Table 4.6 shows, very few youth live as single person households. The mean household size declines by about half a person for households with children aged 10-14 to those with youth aged 25-29, but for each age group, the mean household size is larger in urban areas than in rural area.

* Less than 0.1 per cent.

### 4.3.2 Youth in institutions

Another distinctive feature about young people's living arrangements is the relatively high proportion living in institutions. As already seen in Figure 4.2, youth have higher proportions living in institutions than any other age group. Males aged 20-24 have the highest rates of persons living in institutions ( 13.5 per cent) while the lowest rates are found among female youth aged 25-29 (4.2 per cent). The rate for female youth compared to other females is also high, but less than half of males: some 5.3 per cent of female youth aged 15-24 live in institutions compared with more than twice this percentage ( 12.2 per cent) of their male counterparts (Table 4.7). Thus, of the 774,200 youth aged 15-24 living in institutions, approximately two thirds are males.

Chapter 4. Living arrangements of children and youth

| 15-29 | 540,891 | 352,073 | 188,818 | 12.7 | 16.8 | 8.8 |
| Rural |  |  |  |  |  |  |
| 15-19 | 175,396 | 125,292 | 50,104 | 5.6 | 8.1 | 3.1 |
| 20-24 | 202,832 | 151,256 | 51,576 | 7.1 | 11.0 | 3.5 |
| 25-29 | 166,214 | 125,070 | 41,144 | 5.9 | 9.2 | 2.8 |
| 15-24 | 378,228 | 276,548 | 101,680 | 6.3 | 9.4 | 3.3 |
| 15-29 | 544,442 | 401,618 | 142,824 | 6.1 | 9.4 | 3.1 |

The main economic activity was recorded for everyone aged 10 and over living in an institution. This gives some possible indication of the reasons why youth are living in institutions. Employment appears to be the most important reason. Table 4.8 reports that more than two thirds of both male and female youth living in an institution at the time of the Census were employed during the 12 months prior to the Census ( 68.7 per cent and 67.0 per cent, respectively). The level of activity was only slightly lower among males in conventional households, of whom 65.5 per cent were working, but less than half of female youth in conventional households ( 45.8 per cent) were working, reflecting the fact that over a quarter ( 25.4 per cent) were engaged in household activities. One in ten males and one in five females in institutions were reported to be full-time students.

Male youth living in institutions were three times more likely to be classified as having an 'other' main activity than those in conventional households. This is likely to be primarily male youth staying in religious institutions but may also reflect a higher proportion of young males with disabilities, as discussed in Chapter 5.

## Chapter 4. Living arrangements of children and youth

| Total | 4,574,535 | 46.9 | 4.9 | 51.8 | 19.5 | 24.4 | 4.2 | 48.2 |

### 4.3.3 Youth living independently

By combining the information on relationship to the head of household for youth living in conventional households and the percentage of youth living in institutions, it is possible to calculate the percentage of youth living independently. This is defined as being a head (or spouse of the head) of household, living in a house headed by an 'other' relative or nonrelative, or living in an institution. The proportion living independently rises from a fifth of those aged 15-19 to more than a third of the 20-24 age group, and to just over a half of those aged 25-29 (Table 4.9). The proportions are similar for males and females.

Chapter 4. Living arrangements of children and youth

Table 4.9
Percentage of youth living independently by sex by age, 2014 Census

| Sex/Age group | Relationship to head |  |  | Living in an institution | Total |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | All persons (=100\%) | Head or spouse of head | Other relative* or non-relative |  |  |
| Both sexes |  |  |  |  |  |
| 15-19 | 4,625,989 | 3.0 | 9.5 | 7.9 | 20.4 |
| 20-24 | 4,331,069 | 17.0 | 9.4 | 9.4 | 35.9 |
| 25-29 | 4,146,134 | 36.6 | 6.9 | 7.5 | 50.9 |
| 15-24 | 8,957,058 | 9.8 | 9.5 | 8.6 | 27.9 |
| 15-29 | 13,103,192 | 18.3 | 8.7 | 8.3 | 35.2 |
| Male |  |  |  |  |  |
| 15-19 | 2,290,998 | 1.6 | 9.3 | 10.9 | 21.8 |
| 20-24 | 2,091,525 | 13.0 | 9.5 | 13.5 | 36.0 |
| 25-29 | 1,995,465 | 32.8 | 7.2 | 11.1 | 51.1 |
| 15-24 | 4,382,523 | 7.0 | 9.4 | 12.2 | 28.6 |
| 15-29 | 6,377,988 | 15.1 | 8.7 | 11.8 | 35.6 |
| Female |  |  |  |  |  |
| 15-19 | 2,334,991 | 4.3 | 9.8 | 5.0 | 19.1 |
| 20-24 | 2,239,544 | 20.8 | 9.3 | 5.6 | 35.8 |
| 25-29 | 2,150,669 | 40.1 | 6.5 | 4.2 | 50.7 |
| 15-24 | 4,574,535 | 12.4 | 9.6 | 5.3 | 27.3 |
| 15-29 | 6,725,204 | 21.3 | 8.6 | 4.9 | 34.8 |

* 'Other relative' is a head of household who is not a parent, grand/great grand parent or sibling.

### 4.4 Wealth status of households in which children and youth live

This report looks at many aspects of children's and youth's welfare and describes their activities. To understand what is influencing the patterns of school attendance, child labour, educational attainment, employment and migration it is helpful to look at the economic environment in which children and youth grow up. Such information can help ascertain, for example, if unemployment is associated with poverty or relative privilege.

When examining children and youth, it is common to look at the characteristics of their parents - such as literacy, education and occupation - to infer socioeconomic status. This is problematic for census data because, as explained above, it is not always possible to link children and youth to their parents. In particular, many children live in households headed by their grandparents. Their parents may also be members of the household but it is not possible from the codes used in the questionnaire to be certain who is the child's father and mother. With census data, the characteristics of the head of household are often used as an indicator of the socioeconomic status of the household as a whole. Table 4.10 illustrates why this can be misleading if the focus is on children and youth.

It was shown above that many children and youth lived in a household headed by their grandparent, but had a member of their parental generation also living with them. If only the head of household is considered, Table 4.10 shows that children in households headed

Chapter 4. Living arrangements of children and youth
by grandparents are less likely to have a household head who is literate. In households with children where the parent is the head, 88.5 per cent of children live with a literate head, but where a grandparent is the head this proportion falls to 80.2 per cent - a difference of 8 percentage points. The differential is greater for youth among whom the proportion falls from 88.6 per cent to 78.9 per cent - a difference of almost 10 percentage points, and is even greater in rural areas. The difference is probably because of the recent increases in school attendance and educational attainment. These children's parents are more likely to have similar levels of literacy as the grandparent who headed their own households.

## Table 4.10

Percentage of children and youth living in a household whose head is literate by age by relationship to the head, 2014 Census

| Age group | Union |  | Urban |  | Rural |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Parent is head (\%) | Grandparent is head (\%) | Parent is head (\%) | Grandparent is head (\%) | Parent is head (\%) | Grandparent is head (\%) |
| Total | 88.5 | 80.2 | 94.6 | 86.9 | 86.6 | 77.0 |
| 0-4 | 88.9 | 81.2 | 95.4 | 88.6 | 87.1 | 78.2 |
| 5-9 | 88.2 | 80.2 | 94.9 | 87.2 | 86.4 | 77.1 |
| 10-14 | 88.6 | 79.8 | 94.6 | 86.1 | 86.8 | 76.6 |
| 15-19 | 88.5 | 79.2 | 94.4 | 85.2 | 86.5 | 75.4 |
| 20-24 | 88.8 | 78.4 | 94.3 | 84.5 | 86.5 | 73.7 |
| 25-29 | 88.1 | 76.5 | 93.5 | 82.4 | 85.7 | 72.1 |
| Children 0-14 | 88.5 | 80.5 | 94.9 | 87.5 | 86.7 | 77.5 |
| Youth 15-24 | 88.6 | 78.9 | 94.4 | 85.0 | 86.5 | 74.9 |

A wealth index, using Census information available at the household level, was also constructed to understand the different characteristics of children and youth. The wealth index was generated based on the type of household and information on access to particular household assets collected in the Census (see Appendix 3). This was then used to assign each household member one of five wealth quintiles - equal sized groups of the population each representing 20 per cent of the total population. The wealth index is, therefore, fundamentally different from information on income or consumption, which are direct indicators of absolute poverty. Instead, it provides a measure of relative poverty/wealth as it gives the position of a household compared to other households in the country.

Figure 4.4 shows the percentage of children and youth within each quintile. More than half of rural children ( 58.7 per cent) and youth ( 50.9 per cent) are in the lowest two quintiles. In contrast, urban children and youth live in much better wealth conditions than rural children; just under half of urban children (47.4 per cent) and over half of urban youth (56.2 per cent) live in the highest wealth quintile compared with just 6.1 per cent of rural youth and 4.6 per cent of rural children. Only 3.8 per cent of urban children and 2.4 per cent of urban youth were assigned to the lowest quintile.

Chapter 4. Living arrangements of children and youth

Figure 4.4
Percentage distribution of children and youth by wealth index quintile, urban and rural areas, 2014 Census

The distribution of children by wealth index varies considerably across the States/Regions of Myanmar. Table 4.11 shows that Yangon, Kayah, Mandalay, Nay Pyi Taw, and Shan have higher proportions of children who are in the highest quintile of the household wealth index than the lowest quintile (as shown by the negative differences in the Table). In particular, 44.1 per cent of Yangon children live in the highest wealth quintile, while only 3.2 per cent of Ayeyawady children do so. In contrast 66.9 per cent of children in Rakhine were in the lowest quintile (though some caution should be given to the accuracy of this score in view of the extent of under-enumeration in this State). Ayeyawady, Magway, Bago, Tanintharyi, and Kayin are also among the States/Regions with proportions of the poorest children that are above the Union average of 25.1 per cent. Detailed results by urban and rural areas for each State and Region are presented for both children and youth in Appendix 2, Table A2.17.

Table 4.11
Percentage distribution of children aged 0-14 by wealth index quintile, State/Region, 2014 Census

| State/ Region | Total number of children (=100\%) | Wealth index quintile |  |  |  |  | Difference |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Lowest | Second | Middle | Fourth | Highest | Lowest-highest |
| UNION | 13,995,368 | 25.1 | 22.0 | 19.7 | 18.0 | 15.2 | 10.0 |
| Kachin | 451,502 | 13.6 | 19.6 | 24.4 | 28.8 | 13.6 | 0.0 |
| Kayah | 97,160 | 9.8 | 16.6 | 27.0 | 28.4 | 18.2 | -8.4 |
| Kayin | 529,818 | 25.8 | 18.4 | 21.6 | 21.2 | 13.0 | 12.8 |
| Chin | 189,862 | 20.2 | 13.4 | 30.4 | 29.9 | 6.1 | 14.1 |
| Sagaing | 1,477,357 | 18.1 | 27.8 | 27.7 | 19.7 | 6.8 | 11.3 |
| Tanintharyi | 470,653 | 25.2 | 23.9 | 22.1 | 19.4 | 9.4 | 15.8 |
| Bago | 1,364,369 | 28.2 | 25.9 | 20.3 | 17.1 | 8.5 | 19.6 |
| Magway | 1,033,009 | 28.8 | 29.9 | 21.6 | 13.0 | 6.7 | 22.1 |
| Mandalay | 1,544,174 | 12.7 | 22.9 | 22.5 | 21.6 | 20.2 | -7.5 |
| Mon | 621,619 | 21.6 | 18.7 | 19.6 | 24.6 | 15.5 | 6.1 |
| Rakhine | 642,837 | 66.9 | 16.6 | 7.6 | 5.2 | 3.7 | 63.2 |
| Yangon | 1,677,494 | 12.2 | 12.1 | 11.7 | 19.9 | 44.1 | -32.0 |
| Shan | 1,785,380 | 17.2 | 21.2 | 21.7 | 21.2 | 18.6 | -1.4 |
| Ayeyawady | 1,795,695 | 49.1 | 24.7 | 14.8 | 8.2 | 3.2 | 45.9 |
| Nay Pyi Taw | 314,439 | 17.1 | 21.3 | 20.8 | 18.6 | 22.2 | -5.1 |

Chapter 4. Living arrangements of children and youth
Figure 4.5
Percentage distribution of children by relationship to the head of the household by wealth index quintile, urban and rural areas, 2014 Census

Using this index, Figure 4.5 shows that children living in households headed by a grandparent are not necessarily disadvantaged. In fact, they are much more likely to be in the highest wealth quintile in both urban and rural areas. For example, in urban areas, 52.1 per cent of children living in a household headed by a grandparent belong to the highest quintile, compared with 43.7 per cent of children living in parent-headed households.

### 4.5 Summary

This chapter has described the living arrangements of children and youth, both the people they live with and their economic conditions.

At the Union level, 400,000 children aged 0-14 - less than 3 per cent of children - were enumerated in an institution. The proportion of children in institutions varied between States/ Regions; the highest was in Kachin State ( 8.4 per cent) and the lowest was in Chin State ( 0.7 per cent).

Most children in Myanmar live in conventional households headed by a parent (74 per cent) or grandparent ( 21 per cent). In most cases, a parent is also present in households headed by a grandparent. Using the relationships between members of the household and the household head, it can be estimated that about 5 per cent of children in conventional households live without a parent. The rates of living with a parent are lowest in areas of high in-migration, such as Yangon, or high international emigration.

Youth living in institutions are more likely to be in the age group 15 to 24 than in any other age group: about 12 per cent of male youth and 5 per cent of female youth. Youth living independently is most likely due to marriage (as head or spouse of head). One fifth of youth aged 15-19; more than a third aged 20-24; and over a half aged $25-29$ were living independently.

More than half of rural children ( 58.7 per cent) and youth ( 50.9 per cent) were classified in the lowest two quintile groups of the household wealth index.

## Chapter 5. Health: mortality and disability

The 2014 Census collected data on three topic-related characteristics of population and housing directly related to health. One is the living conditions known to be associated with diarrhoeal and respiratory diseases. These were presented in Chapter 3. Another is information on the birth history of ever-married women aged 15 and over, and deaths in the household during the 12 months prior to the Census, which enables estimates of child and adult mortality to be made. The third is the identification of people who have a disability which makes it difficult for them to perform normal everyday functions. This chapter discusses the last two of these indicators of health.

This information about health is vital for Myanmar since it does not have a fully functioning death registration system, and so any understanding of mortality levels and patterns can only come from surveys and censuses. Several past fertility surveys have attempted to estimate infant and child mortality, but they were not designed to capture the mortality of youth and adults. The 2014 Census provides the most robust estimates of mortality that have so far been available for Myanmar.

Supporting people with disabilities is enshrined in the 2008 Constitution and the 2014 National Social Protection Strategic Plan. Myanmar is also a signatory to the Convention on the Rights of Persons with Disabilities. Accurate information on the prevalence of people with disabilities is essential in order to achieve these policies (UNICEF, 2013). Myanmar does not have a fully functioning system to identify and support people with disabilities. The 2014 Census is the first attempt to collect information on disability on a large scale using international standards of classification.

High levels of mortality and disability in developing countries have many of the same causes. Poor health services, poor living conditions, natural disasters, conflicts and lack of financial resources contribute to high mortality. They also cause and exacerbate disabilities and the difficulties that people with these conditions experience. International studies have consistently shown that the poorest households and communities have the highest prevalence of disabilities (WHO and World Bank, 2011).

Children and youth are directly affected by mortality and disability. This chapter discusses the risks they face and some factors associated with these risks. There are many things that a government can do to improve child and youth survival and to reduce the number of people with a disability and the difficulties they face in participating in society. A strong public health system, accompanied with increasing prosperity in rural and urban areas through improved infrastructure; increased agricultural productivity; and more education, training and employment opportunities are central to the country's Comprehensive National Development Plan and will bring substantial health improvements (World Bank, 2014). The importance of making progress in improving health conditions is part of the 2014 amendments of the 1993 Child Law (Box 5.1).

## Chapter 5. Health: mortality and disability

## Box 5.1

## Child Law (2014 Amendments) as it relates to health

71. The Ministry of Health
(a) Shall make a submission to the Union Government in order to allocate the necessary support and resources from the State to ensure that children's right to health is fulfilled.
(b) Shall develop and implement projects for child survival, universal coverage of vaccination and administration of prophylactic medicine, breastfeeding and supplementary nutritious food for children, family health including safe and sufficient nutrition, elimination of iodine deficiency, as well as Vitamin A, Vitamin B1 and Iron deficiency, prevention and treatment of HIV/AIDS, prevention of mother to child transmission of the disease, school health, reproductive health activities including sex education for teenagers, family planning for mothers, health for pregnant women, prenatal and postnatal health for mothers and infants, maternal mortality reduction, upgrading of safe drinking water and sanitation systems.
(c) Shall take appropriate measures to progressively reduce and eliminate traditional practices that can be harmful to child health.
(d) Shall take steps to minimize infant and child mortality while maximizing the number of healthy welldeveloped children.
(e) Shall take necessary measures to remove or revise policies and regulations that do not contribute or are harmful to child health.

### 5.1 Mortality of young children

This section will show that children and youth in Myanmar have a higher risk of dying than their peers in most other countries in the South-East Asian region. Of particular concern are the high levels of infant mortality and the high rates of male mortality at all ages, but especially during childhood and youth. Using the findings from the Census thematic report on Mortality (Department of Population, 2016b), this section discusses some of the possible causes of the high mortality of young children and male youth.

### 5.1.1 Mortality of infants and children under five

The Census thematic report on Mortality estimated the infant, child and under-five mortality rates using indirect methods based on simple retrospective questions on the number of children recorded for all ever-married women aged 15 and over in the 2014 Census. These questions were 'number of children born alive' and 'how many of those children are no longer alive (dead)?' (See Appendix 1). The numbers of male and female children were recorded separately. See the report Department of Population, 2016b, for a full explanation of the methods used.

As Table 5.1 shows, at the Union level, 62 infants out of 1,000 live births die in the first year of life (the infant mortality rate). This is when young children are at the greatest risk of dying. Between the ages of one and four years, 10 children die out of every 1,000 who survived to their first year. Overall, out of every 1,000 live births, 72 will die before their fifth birthday.

## Chapter 5. Health: mortality and disability

Table 5.1
Mortality rates of infants and children under five, urban and rural areas, State/Region, ranked by level of under-five mortality, 2014 Census

| State/Region/ Area | Infant mortality | Child mortality (ages 1-4) | Under-five mortality |
| :---: | :---: | :---: | :---: |
| UNION | 61.8 | 10.0 | 71.8 |
| Urban | 41.0 | 5.3 | 46.3 |
| Rural | 67.2 | 11.6 | 78.8 |
| Ayeyawady | 86.2 | 17.4 | 103.6 |
| Magway | 83.9 | 16.7 | 100.6 |
| Chin | 75.5 | 14.1 | 89.6 |
| Tanintharyi | 70.8 | 12.6 | 83.4 |
| Bago | 61.9 | 10.1 | 72.0 |
| Rakhine | 61.1 | 9.9 | 71.0 |
| Kayah | 60.1 | 9.6 | 69.7 |
| Sagaing | 60.0 | 9.6 | 69.6 |
| Shan | 55.5 | 8.5 | 64.0 |
| Nay Pyi Taw | 55.4 | 8.4 | 63.8 |
| Kayin | 53.6 | 8.0 | 61.6 |
| Kachin | 52.8 | 7.8 | 60.6 |
| Mandalay | 50.3 | 8.1 | 58.4 |
| Yangon | 44.9 | 6.1 | 51.0 |
| Mon | 41.9 | 5.4 | 47.3 |

Source: Department of Population, 2016(b), Table 2.4.
Table 5.1 ranks the States/Regions by levels of mortality. As measured by all three rates, mortality is highest in the States/Regions of Ayeyawady and Magway and lowest in Yangon and Mon. Table 5.1 also shows that mortality is higher in rural areas than in urban areas. The infant mortality rate is 41.0 in urban areas and 67.2 in rural areas, while under-five mortality rates are 46.3 and 78.8 respectively. Child mortality is more than twice as high in rural areas. Compared to other ASEAN countries, Figure 5.1 shows that Myanmar's estimated infant and under-five mortality rates are very high. Only Lao PDR has a similar level. The rest of the countries shown have rates between 2 to 38 deaths per 1,000 live births. However, the comparison should be interpreted with some caution. While the Myanmar data is from the 2014 Census, the rates for the other ASEAN countries are derived from a range of sources, most of them prior to 2013.

## Chapter 5. Health: mortality and disability

Figure 5.2
Mortality rates of young children by sex, 2014 Census

Source: Department of Population, 2016(b), Figure 2.6.

Another distinctive feature of mortality in Myanmar is the size of the differential in mortality rates among young boys and girls (Figure 5.2). The male infant, child and under-five mortality rates are 30 per cent or more higher than the female rates. In most countries, male mortality is only slightly higher at very young ages (Alkema et al, 2014). In a few countries with strong preferences for sons, female children have higher mortality rates. Significantly higher male early-age mortality rates are rare in developing countries. A possible explanation is that in Myanmar infant boys may be permitted, or even encouraged to be more mobile resulting in greater risks from accidents and, potentially, exposure to infectious diseases (Department of Population, 2016b).

Chapter 5. Health: mortality and disability

### 5.1.2 Factors influencing infant and child mortality

The Census thematic report on Mortality, referred to above, investigated infant and child mortality for many population subgroups. The intention was to learn if some characteristics of the mother, domestic environment or household composition were associated with differentials in the risk of infants and children dying. The results at the Union level are summarized in Table 5.2. The biggest differences were associated with a mother's parity (the number of previous live births a woman has had). Children of women with higher parities have higher probabilities of dying than children of women with lower parities. Children of women who have given birth five or more times have a five times greater probability of dying before the age of five than children born to women who have given birth one or two times. Even children born to women who have had three or four children have three times the probability of dying before the age of five than children of women who have given birth one or two times.

Another large differential shown in Table 5.2 is related to the measures of educational status of their mothers. Children of mothers who are literate and who have attended primary school or high school have lower probabilities of dying. This relationship has been observed across the world, and demonstrates one important reason for ensuring that girls and young women are able to attend and complete their schooling (Cleland and van Ginneken, 1988).

The children of mothers living with other adult females and young children (not necessarily their own) have lower probabilities of dying at a young age. This suggests that the traditional extended family, or more precisely, the presence of more women to look after children, has a protective effect, contributing to better child survival.

A final set of differentials in Table 5.2 captures both the degree of household poverty and indicates the level of economic development in the local area of the mother's residence. Possession of/access to modern communication devices, the presence of electricity, and the head of household's literacy and high school completion are all associated with lower probabilities of early child mortality.

## Chapter 5. Health: mortality and disability

Table 5.2
Infant, child and under-five mortality rates by selected characteristics, 2014 Census

| Characteristic | Infant <br> mortality | Child <br> mortality | Under-five <br> mortality |

* Includes landline phone, mobile phone and internet at home.

Source: Department of Population, 2016b, Table 4.1.
It should be noted that these differentials are not additive. Several of these factors may be measuring the same causes of under-five mortality, such as the number and timing of births,

## Chapter 5. Health: mortality and disability

and poverty and child care practices. Investigating all of the factors together could result in some associations with mortality disappearing and others becoming more important. For example, the effect of improved sanitation may disappear if considered together with a mother's education or availability of electricity. This observation has policy implications. Changing one factor, such as access to a flush toilet, may not necessarily result in lower child mortality if other factors are not also improved.

Figure 5.3
Early-age mortality, Townships, 2014 Census

Source: Department of Population, 2016(b), Figure 5.1.

## Chapter 5. Health: mortality and disability

### 5.2 Mortality of older children and youth

In addition to information on the deaths of children of ever-married women, the 2014 Census asked people in conventional households if a usual resident had died in the previous 12 months, and the sex and age at death was recorded for each person who had died. Because this information is known to underestimate deaths, the Census thematic report on Mortality used the age pattern of reported deaths along with other information on the age structure and mortality patterns in model life tables to make indirect estimates of mortality among the population aged five years and above. A detailed explanation of the methods used is given in the Report (Department of Population, 2016b).

The results show that, as in the case with early-age mortality, male adult mortality is high. Life expectancy at birth, which can be interpreted as the average number of years that a newborn baby can expect to live if it were to experience, throughout its lifetime, current levels of mortality, is 60.2 years for males and 69.3 years for females. This nine-year difference between males and females is due principally to higher male mortality starting in youth and continuing throughout their adult years. Such a large difference in mortality between the sexes is unusual in developing countries (UN Population Division, 2013).

Figure 5.4 shows the probability of dying, $(q(x)$ ), in each age group from ages 5-9 to 55-59. (This figure is the proportion of people who will die during the interval, out of all people alive at the start of the interval. For example, $q(5)$ means the proportion of children who are alive at age five and will die before reaching the age of ten). At all ages female mortality is lower than male mortality and there is little difference between urban and rural females. Male mortality rates start to diverge considerably from female rates at ages 20-24. Moreover, at ages 25-29 male mortality rates in urban areas are noticeably higher than in rural areas.

The mortality rates for children aged five and over and for youth up to age 29 are shown at Table 5.3. Male mortality is higher at every age, and the difference increases during their twenties. Compared to females, males in urban areas are almost twice as likely to die between the ages of 15 and 19 and more than three times as likely to die between the ages of 25 to 29 . The Census thematic report on Mortality also found that, although the size of the gap varies, every State/Region demonstrates higher male mortality at all ages. Addressing high male mortality will require identifying the risk factors that develop between the ages of 15 to 24 .

| 25-29 | 0.01674 | 0.00680 | 0.02018 | 0.00563 | 0.01526 | 0.00733 | 2.5 | 3.6 | 2.1 |

Figure 5.5 shows the estimated level of male youth mortality in States/Regions. It is derived from the Union life tables presented in Appendix E of the Census thematic report on Mortality. As shown in Table 5.3, at ages 15-24 rural mortality, at the Union level, is higher than urban mortality, but some of the border States/Regions experience the highest levels of male youth mortality, including those States/Regions that have been affected by conflict.

Chapter 5. Health: mortality and disability

Figure 5.5
Estimated death rates (10m15) for male youth aged 15-24 by State/Region, 2014 Census

The reasons for the high rates cannot, of course, be determined from the Census data, and there are no robust cause of death data for Myanmar. Internationally, it is more common to find male mortality to be much higher than female mortality in developed countries. In developing countries the gender gap is usually smaller (UN Population Division, 2013), but there is a trend of increasing mortality among young adults in developing countries (GBD 2013 Mortality and Causes of Death Collaborators, 2015). The leading causes of death in this age group are from road traffic injuries, suicide and interpersonal violence. In some countries, alcohol, tobacco and other drug misuse are major causes of death. One or more of these causes may be behind the high rates of young male mortality in Myanmar. Underlying these causes are behaviours established in youth, which continue through adulthood and can contribute to higher male mortality at every age. These behaviours need to be altered in youth, before they become lifelong habits.

### 5.3 Children and youth with disabilities

The prevalence of disability in a population is the result of a complex and dynamic relationship between health conditions and contextual factors, both personal and environmental (WHO and World Bank, 2011, p. 32).

According to the Child Law (2014 Amendment) a child with a disability means a child suffering from one or more forms of long term impairment; physical, visual, speech, auditory, cognitive, mental, intellectual, or sensory, which may be either congenital or otherwise.

The Myanmar Policy for Early Childhood Care and Development recognized the rights of young children aged 0-8 with special needs, and specifically those with developmental delays and disabilities (Department of Population, 2014c). The objective is to help each child reach his or her full potential and to reduce stigma, abuse, neglect and exploitation. One target is to end the practice of very young children being placed in institutions. These objectives are

Chapter 5. Health: mortality and disability
to be achieved through a combination of community outreach, identification and referral to support services.

The 2014 Census measured disability with a four-dimensional question, consistent with the International Classification of Functioning, Disabilities and Health (ICF); recently available guidelines of WHO and UNESCAP; and national documents as the framework and guidelines for analysis. The question measures 'functional disability', that is the extent that an individual's health condition limits his or her activities and ability to participate in daily activities. The degree of disability experienced is affected by the individual's environment. The Census question covered four core domains of functioning: seeing, hearing, walking, and remembering or concentrating. Each domain had four response categories: 1) No, no difficulty; 2) Yes, some difficulty; 3) Yes, a lot of difficulty; and 4) Cannot do at all (see Q9 at Appendix 1).

These four degrees of difficulty were used to capture the full spectrum of functioning from 'none' to 'mild' (some difficulty), 'moderate' (a lot of difficulty), and 'severe' (cannot do at all), or four levels of disability on the disability continuum. Individuals may, of course, have a disability in one or more domains. When a person reported multiple disabilities, he or she was classified based on the classification for the most severe disability. For example, if a child was reported as having 'some difficulty' walking and 'a lot of difficulty' seeing, he or she was classified as having 'a lot of difficulty' (or moderate). Children with a disability are those with mild, moderate, or severe levels of disabilities across one or more domains.

This section refers to, and builds on, the information on children and youth published in the 2014 Census thematic report on Disability (Department of Population, 2017c). The primary indicator of the prevalence of disability is the proportion of children and youth reported as having at least a mild disability.

### 5.3.1 Prevalence of disability

Table 5.4 shows the percentage of children and youth reported to have some degree of disability. The overall rate for both sexes was 1.4 per cent for children and 1.2 per cent for youth, amounting to some 197,000 children and 110,000 youth reported to have a disability. The prevalence in childhood and youth is lower than in the total population as a whole (4.6 per cent) and, not surprisingly, much lower than the 23.3 per cent reported for older persons aged 60 and over. However, the prevalence of disability in children should be interpreted with caution. The numbers enumerated in the 2014 Census are probably underestimates of the number of children with these conditions. Disabilities can be difficult to discern at younger ages (Department of Population, 2017c).

## Chapter 5. Health: mortality and disability

Table 5.4
Percentage of children and youth with a disability by sex by age, urban and rural areas, 2014

## Census

| Age group | Union |  |  |  | Urban |  |  |  |  |

| 0-4 | 1.69 | 1.71 | 1.66 | 1.02 | 1.03 | 1.02 | 1.90 | 1.94 | 1.86 |
| $5-9$ | 1.17 | 1.27 | 1.07 | 0.87 | 0.94 | 0.80 | 1.27 | 1.37 | 1.16 |
| $10-14$ | 1.28 | 1.38 | 1.18 | 1.00 | 1.03 | 0.97 | 1.38 | 1.51 | 1.25 |
| $15-19$ | 1.22 | 1.29 | 1.16 | 0.92 | 0.96 | 0.87 | 1.36 | 1.44 | 1.28 |
| 20-24 | 1.24 | 1.33 | 1.15 | 0.87 | 0.95 | 0.80 | 1.43 | 1.53 | 1.33 |
| Children 0-14 | 1.37 | 1.45 | 1.29 | 0.97 | 1.00 | 0.93 | 1.50 | 1.60 | 1.41 |
| Youth 15-24 | 1.23 | 1.31 | 1.15 | 0.89 | 0.96 | 0.83 | 1.39 | 1.48 | 1.31 |
| Adults 25-59 | 4.28 | 4.36 | 4.20 | 3.16 | 3.29 | 3.04 | 4.79 | 4.84 | 4.74 |
| Population $60+$ | 23.31 | 22.38 | 24.01 | 18.34 | 17.29 | 19.08 | 25.50 | 24.49 | 26.28 |

Among children and youth, boys were more likely to be reported as having a disability than girls. It is not possible to determine from the Census data if boys actually suffered higher levels of prevalence or if their disabilities were just more likely to be identified. The true answer is likely to be that both factors are present. Underlying the higher mortality rates of boys and male youth would be higher morbidity and trauma, which could result in disabilities. The expectation that young males are more physically active than females may result in disabilities being recognized and constituting a greater handicap in performing expected roles.

Attempts to measure the prevalence of disability are relatively recent and involve a number of methodological challenges (WHO and World Bank, 2011). The rate of disability in children reported in the 2014 Census is lower than the estimated 5.2 per cent of children aged 0-14 in South-East Asia who have moderate to severe disabilities, based on the 2004 Global Burden of Disease Study. In addition to the challenges of measuring disability in childhood, the lower prevalence may be the result of the use of only four domains of disability rather than the six recommended by the Washington Group (United Nations, 2008).

Among children and youth who reported some level of disability, Table 5.5 shows that about 60 per cent were reported to have only a mild form of disability in one or more domains.

## Chapter 5. Health: mortality and disability

Table 5.5
Percentage distribution of children and youth with a disability by degree of disability, urban and rural areas, 2014 Census

| Population group | Degree of disability (percentage) |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: |
| UNION | Total number <br> (=100\%) | Mild (Some <br> difficulty) | Moderate (A lot <br> of difficulty) | Severe (Cannot <br> do at all) |  |
| Children 0-14 | 197,163 | 60.1 | 21.9 | 18.0 |  |
| Youth 15-24 | 110,118 | 63.5 | 19.1 | 17.4 |  |
| Children and youth (0-24) | 307,281 | 61.3 | 20.9 | 17.8 |  |
| Urban |  |  |  |  |  |
| Children 0-14 | 34,595 | 56.4 | 21.7 | 21.9 |  |
| Youth 15-24 | 26,187 | 64.9 | 17.2 | 17.9 |  |
| Children and youth (0-24) | 60,782 | 60.1 | 19.8 | 20.2 |  |
| Rural |  |  |  |  |  |
| Children 0-14 | 162,568 | 60.8 | 21.9 | 17.2 |  |
| Youth 15-24 | 83,931 | 63.1 | 19.7 | 17.2 |  |
| Children and youth (0-24) | 246,499 | 61.6 | 21.2 | 17.2 |  |

Figure 5.6 shows the prevalence for each of the four domains of disability. 'Remembering or concentrating' and 'walking' were the most commonly reported domains of disability. Children of both sexes were more likely to be reported as having at least some difficulty walking and remembering or concentrating than youth, but the reverse is true for the hearing and seeing domains. Females were somewhat less likely to be reported as experiencing disabilities across most domains. The percentages were higher in rural areas than urban areas but the patterns were much the same. A detailed table of the prevalence of disability in each domain by sex and age is given at Appendix 2, Table A2.18.

Figure 5.6
Percentage of children and youth with a disability by sex by domain of disability, 2014 Census

## Chapter 5. Health: mortality and disability

### 5.3.2 Geographic distribution of children and youth with disabilities

The recent Social Protection Policy and amendments to the Child Law emphasize the importance of ensuring that children and youth with disabilities receive the appropriate services. These documents acknowledge that this will be difficult, and that some targeting of programmes to reach areas where there is the greatest need may be necessary in the initial stages of implementation. Figure 5.7 accordingly shows the distribution of children and youth with a disability as a percentage of all children and youth by State/Region, while Table 5.6 lists, in terms of absolute numbers, the ten Districts with the highest number of children with reported disabilities. The full data set is presented in Appendix 2, Table A2.19.

Figure 5.7
Percentage of children and youth with a disability, State/Region, 2014 Census

The percentage of children with a disability is low and a range of between 1 and 2 per cent may not be meaningful - though it is noted that the highest levels of prevalence (in Chin and Ayeyawady) are twice the level reported in Sagaing. Nevertheless, the prevalence for the States/Regions and Districts reflect the link between poverty and disability found throughout the world.

Table 5.6
Top ten Districts with the highest numbers of children aged 0-14 with a disability, 2014 Census

| State/Region | District | Number of children <br> with a disability |
| :--- | :--- | ---: |
| Ayeyawady | Pathein | 9,610 |
| Ayeyawady | Phyapon | 7,150 |
| Yangon | North Yangon | 7,093 |
| Ayeyawady | Hinthada | 6,057 |
| Ayeyawady | Labutta | 5,847 |
| Shan | Taunggyi | 5,722 |
| Bago | Bago | 5,627 |
| Tanintharyi | Myeik | 5,586 |
| Kayin | Hpa-an | 5,584 |
| Ayeyawady | Maubin | 5,525 |

## Chapter 5. Health: mortality and disability

### 5.3.3 Children with a disability in institutions

Chapter 4 presented information on children living in institutions. This section considers whether children with disabilities are more likely to be living in an institution than in a conventional household. Only data on young children aged 0-4 are shown because the Government of Myanmar has indicated their intention to reduce the number of children aged three and under in institutions to zero (Department of Population, 2014c).

Table 5.7 shows that of the total number of young children with a disability, 1.5 per cent were enumerated in an institution. This rate is only slightly higher than the percentage of all young children without a disability living in an institution at the time of the Census ( 1.3 per cent). However, children, and in particular boys, with a severe disability were about twice as likely to be living in an institution. Young children with at least some difficulty seeing or hearing were two times more likely to be living in an institution than those children with at least some difficulties walking or remembering or concentrating.

Table 5.7
Number and percentage of young children aged 0-4 in institutions by sex by degree and domain of disability, 2014 Census

| Total population and living in institution/Sex | No disability | Degree of disability |  |  |  |

| \% living in institution | 2.6 | 2.3 | 1.5 |  | 1.5 |

Chapter 5. Health: mortality and disability

### 5.3.4 Childhood disability and poverty

A recurring finding in the growing evidence concerning disabilities is that they are more prevalent amongst the poor (WHO and World Bank, 2011). This is the result of the higher disease burden in poor households and communities and the lack of resources to minimize difficulties through aids such as glasses, wheelchairs and therapy.

Table 5.4 above showed that children and youth in rural areas have higher levels of prevalence of disabilities than those in urban areas. Figure 5.8 shows that youth with at least some disability are more likely to live in poorer households. The table uses the household-based wealth index presented in Chapter 4 as a measure of poverty. The difference in the urban/ rural profiles is stark. Among rural youth with a mild disability (some difficulty), only 4.3 per cent belong to the highest wealth quintile, compared with almost half ( 48.4 per cent) of urban youth with a disability. Similar urban/rural differences can be seen in the profiles of those youth with higher degrees of disability. There are very little gender differences in the different levels of disability by wealth index quintiles as presented in Appendix 2 , Table A2.20.

Figure 5.8
Percentage of youth in conventional households by disability status by sex by wealth index quintile, urban and rural areas, 2014 Census

### 5.3.5 Disability and transitions into adulthood

Another global finding is that children and youth with disabilities are excluded from participating in regular activities. Increasing opportunities for participation is a human right and forms an important part of the Government of Myanmar's National Social Protection Strategic Plan (Department of Population, 2014c). This section presents evidence on the degree of participation in schooling, employment and marriage.

Table 5.8 shows stark differences in school attendance between children with and without a disability. While 72.1 per cent of children without a disability were reported as currently

## Chapter 5. Health: mortality and disability

attending school, less than half ( 45.8 per cent) of children with some degree of disability were currently attending. Not surprisingly, this proportion dramatically decreases as the level of severity of disability increases. Among boys aged 10-14, for example, the proportion currently attending school fell from 59.1 per cent for those with only a mild disability to 15.7 per cent for those with a severe disability. Children with difficulty walking or remembering or concentrating were the least likely to be attending school.

Table 5.8
Percentage of children aged 5-14 in conventional households currently attending school by degree and domain of disability by sex by age, 2014 Census

| Age group/Sex | No disability | Degree of disability |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Some difficulty (mild) | A lot of difficulty (moderate) | Cannot do at all (severe) | With a disability |

| 5-9 | 51.4 | 47.9 | 33.3 |  | 36.8 |
| 10-14 | 56.7 | 47.0 | 35.3 |  | 32.0 |
| Total (5-14) | 54.6 | 47.4 | 34.3 |  | 34.3 |

Low school attendance during childhood means that youth with a disability are less likely to be literate. Table 5.9 shows that youth literacy as measured in the Census was nearly universal among youth without a disability ( 94.3 per cent), but for those with a mild disability this proportion dropped to 78.8 per cent, and to just over a half for youth with a moderate disability ( 52.2 per cent). Only a third of those with a severe disability ( 33.1 per cent) were literate. Youth with difficulties remembering or concentrating had the lowest literacy rate among the domains.

## Chapter 5. Health: mortality and disability

Everyone over the age of ten living in conventional households and institutions had their main activity in the 12 months preceding the Census recorded. Table 5.10 shows that children and youth with a disability were less likely than those without a disability to be employed or reported as a student, and (not surprisingly) much more likely to be recorded as 'ill or disabled'.

Table 5.11 shows that young men and women with disabilities were also less likely to be married.

### 5.4 Summary

This chapter covered two aspects of health - mortality and disability. These are closely related as the underlying causes of high mortality and disability are determined by rates of illness and injury which are caused mainly by unsafe and unhygienic living conditions and poor health services.

Among all of the ASEAN countries, Myanmar and Lao PDR have the highest rates of infant and under-five mortality. As reported in the Census thematic report on Mortality, out of every 1,000 babies born alive in Myanmar, 62 will die before their first birthday and a further

## Chapter 5. Health: mortality and disability

72 will die before they are five years old. Rural children are much more likely to die than urban children: the rural infant mortality rate was 67 per 1,000 live births compared with the urban rate of 41 . Individual factors associated with a greater risk of dying include maternal education and the number of children a mother has had; access to improved sources of drinking water; access to improved sanitation; electricity; a phone/internet at home; and the number of adult women living in the household.

In Myanmar, males suffer substantially higher levels of mortality at all ages. This disadvantage accumulates; the life expectancy for males is only 60.2 years compared to 69.3 for females. A gap this large is unusual for developing countries. Based on the experiences of other countries, male mortality may be the result of disproportionately high rates of road traffic injuries, suicide, interpersonal violence, alcohol, tobacco and other drug misuse. Many of these behaviours start in early youth.

The prevalence of disability in a population is the result of a complex and dynamic relationship between health conditions and contextual factors, both personal and environmental. Questions in the 2014 Census identified how well children and adults could function across four domains: hearing, seeing, walking and remembering or concentrating. Anyone who was reported as having at least some difficulty in any one of the four domains was classified as having a disability.

The resulting rates are believed to be underestimates but the underlying patterns are still informative. Males are more likely to have a disability than females at all ages. Children and youth with a disability are more likely to live in rural areas, the poorer States/Regions, and poorer households. The vast majority of children and youth with a disability live in conventional households. The rate of young children with a disability living in an institution is slightly higher than those children without a disability living in an institution. Children with a disability are less likely to be attending school and youth with a disability are more likely to be illiterate and less likely to be employed and married.

## Chapter 6. Children at school and work

This chapter traces children's progress through school and early employment and is intended to assist in monitoring the national goal of universal basic education (see Box 6.1) as well as policies and laws that govern children's participation in the labour market, particularly child labour. It examines children's attendance and educational attainment at each age, with an emphasis on the transition to, and completion of, each level of schooling. Some additional details are provided about children who do not complete their school education.

The chapter describes the proportion of children who are economically active, their occupations, and the industries in which they work in the different parts of the country. To the extent possible, it also explores the trade-offs between schooling and work and the characteristics of persons who choose either of these options.

Throughout this report generally 'children' are defined specifically as persons aged $0-14$. However, the International Convention on the Rights of the Child and international organizations such as UNICEF define 'children' as everyone under the age of 18 . This distinction is particularly important when considering issues such as child labour, discussed in this chapter, and marriage, discussed in Chapter 8. Consequently, several different age groups are discussed in this chapter, not only to reflect the structure of the public school system and the laws relating to children's work, but also to be more consistent with international definitions of children.

## Child Law (includes 2014 Amendments) on education

73. The Ministry of Education
(a) Shall make a submission to the Union Government in order to allocate the necessary support and resources from the State to ensure that children's right to education is fulfilled.
(b) Shall implement free compulsory primary education across the country.
(c) Shall make plans to implement free compulsory education up to middle school level and then to high school level, depending on national economic development.
(d) Shall take necessary measures to ensure school enrollment and regular attendance of children, reduce drop-out rates and enable completion of education.
(e) Shall implement non-formal education programmes for out-of-school children who cannot attend schools established by the State for various reasons to provide them with basic literacy and numeracy.
(f) Shall make arrangements to enable the use of ethnic languages in schools as the medium of instruction in accordance with the guidance of the Union Government.

### 6.1 Starting school, staying in school and completing school

This section is concerned with school attendance and the attainment of basic educational qualifications, from primary to high school, focusing on children and adolescents from age 5 to 19 . It also explores the links between child labour and schooling. Chapter 7 will then investigate how educational attainment subsequently affects working, living arrangements and family formation of youth between the ages of 15 and 24 or 29.

In 2014, the public school system in Myanmar consisted of primary school, middle school

Chapter 6. Children at school and work
(more often now referred to as lower secondary school), and high school (upper secondary); encompassing a period of education of eleven years in total. The structure of the three levels and the normative ages of students for each grade are summarized in Box 6.2. Children can start school from the age of five but many start later (Department of Population, 2017d). Because of this, and because some children repeat grades, the concordance between age and grade attended or completed is not perfect.

At the time of the 2014 Census, there were private and public pre-schools for children aged three and four years old, and the current policy is to expand pre-schools and introduce kindergartens. However, information on pre-school and kindergarten attendance was not captured in the Census, which only recorded attendance in respect of persons aged five years and over at school or in post-school educational institutions such as universities.

Box 6.2
Structure of Myanmar's basic education system

| Level | Normative age | Grade |
| :--- | :--- | :--- |
| Primary school | Age 5-9 | Grade 1-5 |
| Middle School | Age 10-13 | Grade 6-9 |
| High School | Age 14-15 | Grade 10-11 |

### 6.1.1 Measuring schooling

Children's schooling was measured in the 2014 Census through four questions. Each question captures a different aspect of schooling (see Appendix 1). The first question (Q19) related to education was on literacy, and asked whether the person could read and write in any language. Illiteracy rates for youth are presented in Chapter 7.

Q20 on the conventional household questionnaire, asked if each person aged five and over 'is currently attending, previously attended or never attended school/college'? This question was not included in the institutional questionnaire. Because the Census was conducted between 29 March and 10 April, corresponding to a school holiday - marking the end of the academic year - enumerators were instructed to ask about attendance in the school year that had just finished. Still, this could have resulted in some confusion between currently attending and previously attended categories. For these and other reasons, the number of children reported as 'currently attending' is not necessarily equal to the number who attended school at any time during the previous school year.

The third question about education in the Census was Q21 in the conventional household questionnaire (which was also asked in the institutional questionnaire). All persons aged five and over were asked: 'What is the highest education grade/level completed'? Nineteen answers were coded: none; Grades 1 to 11; college; vocational training; undergraduate diploma; graduate; postgraduate diploma; master's degree; PhD; and other. In most cases, 'other' refers to advanced religious training. The highest grade completed allows comparisons of educational qualifications across all age groups and is the primary indicator of schooling used in this report.

Chapter 6. Children at school and work

More details about the education questions are given in the 2014 Census thematic report on Education (Department of Population, 2017d).

A fourth Census question enquired into a person's economic activity status, recorded for every person aged 10 and over in both institutions and conventional households (Q22 on the household questionnaire). Being a full-time student was one of the pre-coded answers for activity status in addition to being employed (as an employee in the government or in a private organization); an employer; being self-employed (own account worker) or as an unpaid worker in a family business (contributing family worker); seeking work; household work; and being ill or disabled. This question referred to the main (or usual) activity during the 12 months prior to the Census which was therefore not necessarily the same as the person's current status at the time of the Census in the same way that the status of attending or previously attending school was, as recorded in the question on school attendance.

### 6.1.2 Children currently attending school

At the time of the Census, 71.2 per cent of primary school-age children (aged 5-9) were reported as currently attending school, with little or no variation between urban and rural areas and sexes (Table 6.1). The proportion of lower secondary-age (middle school) children (aged 10-13) attending school was slightly higher ( 76.2 per cent) but, again, with little variation between urban and rural areas and sexes. However, notable differences were observed for upper secondary-age (high school) children (aged 14-15), where only about half were currently attending school, and with this proportion being much higher in urban areas (59.2 per cent) than in rural areas (47.3 per cent). Gender parity in current school attendance was maintained in this age group. The general pattern where current school attendance was lowest among upper secondary children and where there was gender parity was observed across all States/Regions. However, there were wide variations in attendance rates of children of all school ages, with Chin and Kachin reporting the highest rates while Shan and Kayin reported the lowest.

Chapter 6. Children at school and work

## Table 6.1

Current school attendance rates of children by school-age group by sex, urban and rural areas, State/Region, 2014 Census

| State/ Region/ Area | Attendance rates |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Primary school age (5-9) |  |  | Lower secondary (middle school) age (10-13) |  |  | Upper secondary (high school) age (14-15) |  |  | Total school age (5-15) |  |  |
|  | Both sexes | Male | Female | Both sexes | Male | Female | Both sexes | Male | Female | Both sexes | Male | Female |
| UNION | 71.2 | 70.7 | 71.7 | 76.2 | 76.4 | 76.0 | 50.5 | 50.2 | 50.9 | 69.4 | 69.3 | 69.5 |
| Urban | 70.7 | 70.3 | 71.0 | 77.2 | 77.2 | 77.3 | 59.2 | 58.0 | 60.2 | 70.9 | 70.6 | 71.2 |

### 6.1.3 Children's educational attainment

Attending and completing at least some primary school grades has become an almost universal experience for children in Myanmar. However, not all children complete primary school, and even fewer go on to attend and finish lower and upper secondary school. Figure 6.1 shows the highest grade completed for children aged 15, 16, 17, 18 and 19 years old at the time of the Census. All 19 year olds can be assumed to have finished their basic schooling.

Among children aged nine only 17.7 per cent had completed primary and some secondary education. Among children aged 10 and 11 , the figures were 45.3 per cent and 67.9 per cent respectively, indicating that most children start formal school at the age of six or seven. The completion rate declines after primary school. Children aged 14 to 16 are expected to have completed their middle school grades. However, only 32.1 per cent of children aged 14 years and 25.5 per cent of children aged 16 years had done so. Table 6.2 provides the information for the key educational stages: starting primary school (Grade 1); finishing primary school (Grade 5); finishing lower secondary school (Grade 9); and finishing upper secondary school (Grade 11).

## Chapter 6. Children at school and work

Figure 6.1
Proportion of children and youth by highest grade completed by age, 2014 Census

Note: The proportions shown in the Figure refer to the 19 -year old cohort.

Table 6.2
Percentage distribution of persons aged 7-19 by highest grade completed by age, 2014 Census

| Age | Total persons (=100\%) | None (\%) | Grade 1 to 4 <br> (\%) | Grade 5 to 8 (\%) | $\text { Grade } 9 \text { to } 10$ (\%) | Grade 11 and higher (\%) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 7 | 996,330 | 11.3 | 88.7 |  |  |  |
| 8 | 957,490 | 8.2 | 89.4 | 2.4 |  |  |
| 9 | 951,527 | 5.5 | 76.8 | 17.7 |  |  |
| 10 | 1,021,064 | 6.3 | 48.4 | 45.3 |  |  |
| 11 | 942,615 | 4.3 | 27.8 | 67.9 |  |  |
| 12 | 1,046,459 | 5.2 | 20.1 | 73.0 | 1.6 |  |
| 13 | 1,081,270 | 5.0 | 15.1 | 66.7 | 13.2 | * |
| 14 | 1,007,522 | 4.8 | 13.2 | 48.6 | 32.1 | 1.3 |
| 15 | 958,937 | 6.6 | 13.5 | 37.7 | 33.6 | 8.6 |
| 16 | 882,756 | 5.9 | 13.8 | 35.0 | 25.5 | 19.8 |
| 17 | 904,626 | 5.7 | 13.8 | 35.2 | 20.8 | 24.5 |
| 18 | 1,015,518 | 7.2 | 15.1 | 35.6 | 18.5 | 23.7 |
| 19 | 849,728 | 5.8 | 14.1 | 34.8 | 18.7 | 26.6 |

*Less than 0.1 per cent.
As noted above, there is not a perfect correspondence between the age and the grade completed because children start school at different ages and many repeat grades, although the completion rates in Table 6.2 stabilize two to three years after the age when children are expected to complete a level of schooling. This finding suggests it takes a long time for a cohort to complete and progress to the next level or to leave school permanently.

Chapter 6. Children at school and work

### 6.1.4 Factors influencing children's educational attainment

To understand variations in levels of educational attainment by variables such as sex and socioeconomic status, and between urban and rural areas, this section highlights the experiences of children aged selectively 12, 15 and 17. Note that the Census asks about completing grades and not about passing the final exams to matriculate from upper secondary/high school. Many students retake the matriculation exam until they pass, leading to higher proportions completing in successive years (Tanaka et al, 2015).

Table 6.3 compares the highest educational attainment of boys and girls in urban and rural areas. In both settings, boys aged 15 and 17 are more likely to complete lower secondary school (Grades 9/10) while girls are more likely to complete Grade 11 or higher education. In urban areas, 43.2 per cent of females aged 17 had completed Grade 11 while this figure was only 34 per cent among boys of the same age. The respective proportions in rural areas were 20.5 per cent of girls and 15.1 per cent of boys.

Table 6.3
Percentage of children/youth by highest grade completed by selected age by sex, urban and rural areas, 2014 Census

| $\begin{aligned} & \text { Sex/ } \\ & \text { Age } \end{aligned}$ | Union |  |  |  |  | Urban |  |  |  |  | Rural |  |  |  |  |

| 12 | 5.7 | 21.6 | 71.2 | 1.5 |  | 3.1 | 14.7 | 79.7 | 2.5 |  | 6.6 | 24.1 | 68.2 | 1.2 |  |
| 15 | 6.8 | 14.0 | 39.5 | 32.7 | 7.0 | 2.9 | 9.6 | 31.6 | 43.7 | 12.1 | 8.5 | 15.9 | 42.7 | 28.1 | 4.9 |
| 17 | 5.8 | 13.9 | 36.0 | 22.9 | 21.3 | 2.6 | 9.5 | 27.0 | 26.9 | 34.0 | 7.4 | 16.0 | 40.5 | 21.0 | 15.1 |
| Female |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 12 | 4.8 | 18.6 | 74.9 | 1.7 |  | 2.4 | 12.5 | 82.6 | 2.5 |  | 5.6 | 20.7 | 72.3 | 1.4 |  |
| 15 | 6.4 | 13.0 | 35.9 | 34.5 | 10.2 | 2.6 | 9.1 | 25.3 | 45.9 | 17.2 | 7.9 | 14.5 | 40.1 | 30.0 | 7.5 |
| 17 | 5.7 | 13.7 | 34.4 | 18.7 | 27.6 | 2.6 | 9.6 | 23.5 | 21.1 | 43.2 | 7.1 | 15.5 | 39.3 | 17.7 | 20.5 |

Rural children are more likely to complete primary education, while urban children are more likely to complete upper secondary and higher education. By age 17, urban children reported higher proportions of completion than rural children in both Grades 9/10 and 11 and higher. Some 24 per cent had completed Grades 9/10 compared with 19.3 per cent of rural children; and 38.5 per cent had completed Grade 11 or higher compared with 17.8 per cent of rural children.

The opportunity for children and youth to stay in school long enough to complete primary, lower and upper secondary levels is affected by their families' economic status. Figure 6.2 shows the proportion of youth aged 17 who completed each level of education by the household's wealth index score (see Appendix 3 for a description of this). A clear relationship between level of education and household wealth emerges. The percentage of the population

Chapter 6. Children at school and work
aged 17 with no completed level of education (none) was highest in the lowest quintile (39.1 per cent) and lowest in the highest quintile ( 6.8 per cent), while the reverse was the case for those who completed Grade 11 or higher education ( 4.6 per cent compared with 42.1 per cent). Details are presented by sex, wealth index, and urban and rural areas in Appendix 2, Table A2.21.

Figure 6.2
Percentage of 17 year olds by highest level of education completed by wealth index quintile, 2014 Census

There are many factors that affect the level of school attendance and subsequent level of educational attainment that the Census cannot measure. Several reports undertaken in collaboration with the Government of Myanmar have investigated the reasons why children do not attend school nor continue beyond primary level education. These include the direct and indirect costs of sending a child to school; the distance to secondary school establishments (and associated travel and boarding costs); poor quality teaching; the need for the child or youth to help support the family; and a lack of confidence that further education will be beneficial (MNPED and UNICEF, 2012). However, although the 2014 Census cannot provide more information on the reasons why some children do not continue schooling, it can provide insights into what they are doing instead of attending school. But first, it is necessary to look at children's participation in the labour force.

### 6.2 Children and work

Children who enter the labour force too early will have limited options to attract better paying work as they grow older (World Bank, 2006). Their education has been compromised and they are restricted to vulnerable employment and low skilled occupations. An option for some of these young people will be to take on high risk employment, either across national borders or within Myanmar.

The Census showed that many children in Myanmar are economically active. They may be working as an employee, as unpaid workers in family businesses, or as 'own account' workers by earning little amounts of money for doing small jobs. This section describes the proportion

## Chapter 6. Children at school and work

of children who, as reported in the Census, were economically active, their occupations and the industries in which they were working.

### 6.2.1 Labour force participation rates

Over the past 30 years there has been no decline, and even a slight increase, in the proportion of children in the labour force. The 1983 census reported that 10.8 per cent of children aged 10-14 were in the labour force: 10.2 per cent of boys and 11.5 per cent of girls. In the 2014 Census, the labour force participation rate for this age group had risen to 12.1 per cent at the Union level: 12.9 per cent for boys and 11.3 per cent for girls (Department of Population, 2017e).

Recently, the Government has strengthened its commitment to reduce child labour. The 2014 amendments to the 1993 Child Law stipulates that children under the age of 12 should not work, and those between the ages of 12 and 14 should only take on light work which will not interfere with their education, health or development (Box 6.3). Employment in Government and some private industry is not permitted before the age of 18 . It will, however, take time to fully implement the child employment laws across the country.

The 2014 Census measured labour force participation by recording the main activity in the 12 months prior to the Census for every person aged 10 and over. The pre-coded categories were: Employee (Government); Employee (Private); Employer; Own account worker; Contributing family worker; Sought work; Did not seek work; Full-time student; Household work; Pensioner, retired, older person; III, disabled; and Other (see Q22 at Appendix 1). Only one response per person was recorded.

Figure 6.3 shows that the Census reported 7.8 per cent of children aged 10-13 in Myanmar as working, with this proportion being more than twice as high in rural areas ( 9.0 per cent) than in urban areas ( 4.3 per cent). There is almost gender parity with only slightly more boys working than girls.

## Chapter 6. Children at school and work

## Box 6.3

## 1993 Child law (2014 Amendments) on employment

## Chapter 16

The Rights to Employment
74.
(a) No child shall be employed for or forced to provide the worst forms of labour that are dangerous.
(b) A child considered employable shall not be younger than 14 years of age. If the free compulsory education system envisaged by the State requires children to be in school until after they have attained the age of 14 years, children in school younger than that age shall not be considered employable.
(c) A child between the ages of 12 years and 14 years may be employed for non-hazardous light work, if such employment is not detrimental to the child's formal education, vocational education or health and development.
(d) A child who has attained the age specified in Sub Section (b) has the right to voluntary employment within the prescribed working hours, the right to leisure and the right to other benefits in accordance with existing labour and employment laws, provided that he or she is in good health and capable of fulfilling the tasks concerned.
75. The Ministry of Labour, Employment and Social Security
(a) Shall establish the hazardous types of employment according to the nature of the work in consultation with the relevant employer and employee organizations.
(b) Shall establish the types of employment allowed for children between the ages of 12 and 14 years under Section 74, Sub Section (c), the maximum working hours and other regulations.
(c) Shall coordinate with relevant Union Ministries to ensure compliance with this Law in the employment of children, the occupational safety, full enjoyment of rights and protection for working children.

The small gender differentials observed are also observed across States/Regions (Table 6.4). Shan Region has the highest proportion of working children (17 per cent) which is more than twice the proportion in the second highest Regions of Magway and Sagaing (both less than 8 per cent). The lowest proportions of working children were in Chin, Rakhine, Kachin, and Tanintharyi (less than 5 per cent).

In recognizing the international definition of a child as a person below the age of 18, Table 6.4 also shows that about one in five children aged 10-17 (21 per cent) in Myanmar were working, with this proportion being higher both for boys ( 23 per cent) than girls ( 19 per cent), and for children in rural areas ( 23.2 per cent) than those in urban areas ( 15.4 per cent). This pattern of a higher proportion of boys than girls is observed across States/Regions. The proportions among the States/Regions show that Shan reported the highest percentages and Chin the lowest.

| Shan | 16.8 | 16.0 | 17.7 | 31.5 | 31.9 | 31.1 |
| Ayeyawady | 7.4 | 8.3 | 6.5 | 20.7 | 24.5 | 16.9 |
| Nay Pyi Taw | 5.0 | 5.0 | 4.9 | 18.3 | 19.8 | 16.8 |

Figure 6.4 shows the proportion of children who were employed or who were not employed but who sought work. Few children under the age of 12 were recorded as being in the labour force: just 2.1 per cent of children in urban areas and 5.4 per cent in rural areas, totalling 90,329 children. As children get older, they are more likely to be in the labour force particularly in rural areas where almost 15 per cent were working or seeking work. By age 14-17 many

## Chapter 6. Children at school and work

children are in the labour force, 29.2 per cent in urban areas and 44.5 per cent in rural areas.
Figure 6.4
Percentage of children/youth working or seeking work by age, urban and rural areas, 2014 Census

Table 6.5 gives more details about the type of engagement these young people have in the labour force. Unemployment is high among some groups. For example, close to 10 per cent of urban girls aged 14-17 in the labour force were recorded as seeking work. This, of course, will have included many that had finished their schooling and were looking for an appropriate job.

In rural areas, more than half of working children were in 'vulnerable' employment. This means that they were either working as unpaid family workers or as 'own account' workers; they were not employed in the formal economy or for a wage. This type of work was less common among working children in urban areas, although it still occured, especially among children under 12 years old, among whom just under a third who were economically active (31.2 per cent) were undertaking such vulnerable work. Rural girls were more likely to be engaged in vulnerable work than boys at all ages.

| Female | 10-11 | 4.7 | 0.5 | 5.2 | 3.8 | 72.5 |
|  | 12-13 | 12.5 | 1.5 | 14.0 | 8.5 | 60.6 |
|  | 14-17 | 35.3 | 3.8 | 39.1 | 21.7 | 55.4 |

At the State/Region level, Figure 6.5 shows that the percentage of children aged 10-11 recorded as working ranged from under 2 per cent in Kachin to over 12 per cent in Shan. In fact, children at each age in Shan were more likely to be working than in any other State/ Region; over a third ( 39 per cent) of all children in Myanmar aged 10-11 who are working live in Shan State.

Chapter 6. Children at school and work

Figure 6.5
Percentage of children/youth working by age, State/Region, 2014 Census

Appendix 2, Table A2.22 gives the percentages of children aged 10-17 in the labour force by type of activity (including those in vulnerable employment) by age for each State/Region, while Appendix 2, Table A2.23 gives the number of children in the labour force by age in each District.

### 6.2.2 Occupation and industry

Table 6.6 shows that most of employed children aged 10-13 work as skilled agricultural forestry and fishing workers (43.1 per cent) and in elementary occupations (23 per cent). This pattern is observed among both males and females and is dominated by the extent of agricultural work in rural areas. In urban areas, most children were employed as services and sales workers ( 28.6 per cent) or as craft and related trades workers ( 25.2 per cent). Note that the data reported in this section refers only to children living in conventional households as information on occupation and industry was not collected from persons living in institutions.

* Less than 0.1 per cent.
"-" Denotes no value (zero).

Figure 6.6 shows the occupations of working children aged 12-13. As with most of the indicators concerning children, the gender differences at these ages are less dramatic than the differences between urban and rural areas. In rural areas about one half of both working boys and girls were employed in agriculture, whereas in urban areas the majority were working in craft or service occupations. Compared to boys of the same age, older girls in urban areas were more likely to be working in elementary occupations and less likely to be working in crafts and related trades. (Elementary occupations is a term used by the International Labour Organization to describe jobs consisting of simple and routine tasks which mainly require the use of hand-held tools and often require some physical effort). The occupations of working children for all age groups are shown in more detail in Appendix 2, Table A2.24.

Chapter 6. Children at school and work

Figure 6.6
Percentage of employed children aged 12-13 in conventional households by sex by occupation, urban and rural areas, 2014 Census

The industries in which children were working shows a pattern similar to the distribution of their occupations, which is not surprising bearing in mind the dominance of agricultural employment. Up to two thirds of employed rural children were working in the agricultural sector while most of the remaining children were in the 'not stated' category (where insufficient information was recorded on the Census questionnaire to enable an industry to be coded during data processing). Rural boys and girls work in similar industries. Differences emerged in urban areas where there is a greater diversity of industries employing children, and where girls aged 10 to 17 years old were more likely to be in manufacturing, trade, and food and accommodation services, and boys were more likely to be working in construction and utilities (Figure 6.7). Full details of the percentage distribution of working children by industry are given in Appendix 2, Table A2.25.

### 6.3 Combining school and labour

When children leave school, even at an early age, they do not immediately start employment. For many, their main activity as reported in the Census was described as 'housework' or 'other'. Figure 6.8 illustrates the transition out of childhood in urban and rural areas. The percentages are given in full in Appendix 2, Table A2.26.

## Chapter 6. Children at school and work

Figure 6.7
Percentage of urban working children/youth aged 10-17 in conventional households by type of industry by sex, 2014 Census

Figure 6.8
Percentage of children and youth by age by main economic activity, urban and rural areas, 2014 Census
a) Urban

b) Rural

Note: Other+ includes those who did not seek work, were ill or disabled, and other.
*Working does not include the contributing family worker category, both are shown separately.

At every age the Census reported that urban children were more likely than their rural peers to be in school. Dropping out of school starts much earlier in rural areas, and many children were working as unpaid family members rather than as employees or as own account workers. By the age of 15 , almost half of rural children were working, contributing as unpaid family workers or doing housework. Among urban children, it is not until the age of 17 that almost half were 'active' in this way. Up to the age of 12 , urban children who were not fulltime students were more likely to be doing housework or contributing to the family business, rather than being employed as employees, employers or own account workers. In rural areas, it is not until the age of 18 that more than one-third of young people out of school were working outside of the family business.

Chapter 6. Children at school and work

Table 6.7 looks at the relationship between education and employment in a different way. The table gives the percentage of children who were working, by their highest completed grade. A high proportion of rural children who did not complete any grade were working. The proportion working generally declines with the level completed, suggesting that it is the students who drop out early who go to work. Those who had made progress through school relative to their age, had lower employment rates. This is as expected, as those with higher education would have just completed their education and were likely to be looking for work compared to those who had left school earlier. The link between leaving school early and starting employment is strong but, as shown in Figure 6.8, it is also common for children to stop attending school without joining the labour force. This finding suggests that the need for child labour is not the only reason children and their parents decide not to continue with school education. Improved access to schools, better infrastructure and teaching and more tangible benefits of remaining in school are needed to increase retention levels.

Table 6.7
Employment rates for children by age by highest level of education, urban and rural areas, 2014 Census

| Age group/Area | Highest level of education |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

### 6.4 Summary

This chapter looked at children in school and work. Most children attend some level of schooling but Myanmar is a long way from the goal of achieving universal basic education from primary through to senior secondary school.

Based on the educational characteristics of children aged under 18, the Census reported that 17.7 per cent of children aged nine years had completed primary education, while this

Chapter 6. Children at school and work
figure was 45 per cent and 68 per cent respectively among children aged 10 and 11 years. The completion rate declines after completing primary education. Only 32 per cent of children aged 14 years had completed middle school. Boys aged 15 and 17 are more likely to complete primary and lower secondary school (Grades $9 / 10$ ) while girls are more likely to complete Grade 11 or higher education. In urban areas, 43.2 per cent of females aged 17 had completed Grade 11 while this figure was only 34 per cent among boys of the same age. Household poverty levels, as measured by the wealth index, are also a predictor of educational attainment. Children from poorer households leave school earlier than children from better-off households.

Despite amendments to the Child Law, child labour is still prevalent in Myanmar. Eight per cent of 10-13 year olds were in the labour force in the 2014 Census, about the same proportion as recorded in the 1983 census. The proportion of young children aged 10-11 who were working was 4 per cent, while 13 per cent of 12-13 year olds were in the labour force. By ages 14-17, when most children had left school, 39.9 per cent were in the labour force: 29.2 per cent in urban areas and 44.5 per cent in rural areas. More than half of working children were in 'vulnerable' work, meaning they were unpaid family labourers or working as own account workers outside of the formal economy. Shan State had the highest proportion of children out of school and in the labour force.

Children who have not continued in school are more likely to be employed than children who have stayed in school to complete primary, middle or senior secondary school. However, not all children who have left school are in the labour force. Many stay at home doing housework or no specific tasks. This finding suggests that child labour is not the only reason that children and their parents decide not to continue with schooling. Education reform is needed to reduce obstacles and increase the benefits of schooling as well as to establish mechanisms to discourage children (and their families) entering the labour force at too young an age.

## Chapter 7. Transition from school to work for youth

This chapter focuses on youth's transition to adulthood. Chapter 6 has noted that by age 15 most young people in Myanmar had finished their basic education (meaning up to the end of secondary school). It is important, however, to contextualize this: by age 15 , every child is expected to have completed Grade 11 but the statistics from Chapter 6 (see Table 6.2) show that less than 20 per cent had done so by age 16 (the percentage for age 15 is not given in the table).

This chapter starts with a brief discussion on literacy, the most important skill that youth take into adulthood. Then it describes the highest level of education youth have completed and their progression into employment. It reviews the main activities of youth and, for those employed, their occupations and the industries in which they work. Particular attention is given to the differences in urban and rural areas and the different paths taken by males and females. There is also an exploration of how educational attainment influences employment opportunities.

Information on youth labour force participation and employment by industry and occupation is presented for young people up to age 29. This extended age group is used here because both the International Labour Organization and Myanmar's Department of Labour define youth as those aged 15 to 29 . The wider age span is also useful to see the pace of transition to adulthood.

### 7.1 Youth and Iiteracy

In the 2014 Census, literacy was recorded with one question asked of all residents over the age of five living in conventional households. The question was 'Can [Name] read and write in any language?' (See Q19 at Appendix 1). The literacy rate is the total number of literate persons in a given age group, expressed as a percentage of the total population in that age group.

While no country can achieve 100 per cent literacy, economic development depends on a literate population. Every child should learn to read and write. Considering that almost all children complete at least some level of primary school education, as shown in Chapter 6, it is to be expected that most of Myanmar's youth are literate. And this is largely true. Table 7.1 shows that the literacy rate for youth aged 15-24 was 94.0 per cent. However, this still leaves almost half a million youth illiterate, nearly half of whom live in Shan State. The low literacy rates in Shan are also consistent with children's low educational attainment rates reported for this State in Chapter 6.

Though not shown in Table 7.1, it can be noted here that the 2014 Census thematic report on Education (Department of Population, 2017d) reported that the literacy rate for the age group 25-29 was 92.2 per cent, reflecting the pattern of diminishing levels of literacy with increasing age.

## Chapter 7. Transition from school to work for youth

## Table 7.1

Literacy rate and number of people illiterate among youth aged 15-24 in conventional households by sex, State/Region, 2014 Census

| Nay Pyi Taw | 97.3 | 98.2 | 96.6 |  | 4,892 | 1,603 |

### 7.2 Educational attainment of youth

### 7.2.1 Basic education

Figure 7.1 shows the percentage of youth aged 20-24 by level of education completed. Information on education attainment was asked of persons in institutions as well as conventional households.

The Census reported some gender differences in school completion rates. Male youth had slightly higher completion rates from Grade 7 to Grade 11 but girls are more likely to complete education higher than high school. Compared to their urban counterparts, rural boys are more likely to complete Grade 1 to 8 while urban boys are more likely to complete middle and upper high school as well as a level higher than high school. (The full data set is given in Appendix 2, Table A2.27).

## Chapter 7. Transition from school to work for youth

Figure 7.1
Proportion of youth aged 20-24 by highest grade completed by sex, urban and rural areas, 2014

## Census

The higher rates of male youth completing primary and lower secondary school grades compared with females were not found among younger children. Table 6.3 showed higher completion rates for girls at these levels. It is possible that girls' higher school completion is a recent phenomenon. Another possible explanation is that boys take more years to complete their schooling.

Gender differences are, however, overshadowed by the very large differences between rural and urban areas. Urban youth are more likely to have completed any level of schooling. They are more likely to have stayed in primary school until they have completed Grade 5, to remain in, and finish, lower secondary school, and to continue into upper secondary/high school and then into higher education. This pattern is true for all age groups and for both males and females (see Appendix 2, Table A2.27).

Table 7.2 shows that literacy rates (for youth in conventional households only) were very low among those who had not completed any level of schooling. For this group, only about one in five was reported as literate. Females are particularly disadvantaged. About one in four of male youth who did not complete any level of education was literate whereas only one in seven females in the same circumstances was literate. The rates were very similar for urban and rural areas suggesting that some amount of formal schooling is essential to learn how to read and write.

## Chapter 7. Transition from school to work for youth

Table 7.2
Literacy rate for youth aged 15-24 in conventional households by level of education by sex, urban and rural areas, 2014 Census

| Level of education | Union |  |  | Urban |  |  | Rural |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Both sexes | Male | Female | Both sexes | Male | Female | Both sexes | Male | Female |
| Total | 94.0 | 94.5 | 93.5 | 97.5 | 97.8 | 97.2 | 92.4 | 92.9 | 91.9 |
| No education | 18.6 | 24.3 | 13.7 | 20.8 | 25.9 | 16.8 | 18.3 | 24.1 | 13.3 |
| Incomplete primary | 98.3 | 98.3 | 98.3 | 98.2 | 98.2 | 98.3 | 98.4 | 98.3 | 98.4 |
| Completed primary | 99.9 | 99.9 | 99.9 | 99.8 | 99.8 | 99.8 | 99.9 | 99.9 | 99.9 |

### 7.2.2 Higher education

At the time of the Census approximately 15.5 to 16.1 per cent of Myanmar youth aged 2024 or 25-29 had taken a higher education course (Figure 7.2 and Appendix 2, Table A.2.27). Students may have attended on campus, or were studying off-site or a combination of both. Most of the youth who reported having higher education had attended college or university. Vocational training is not widely available in Myanmar. Table 7.3 shows the attainment rate for different forms of higher education. University or college comprises over 90 per cent of the total. Young women are slightly more likely to have completed post-secondary school than young men ( 18.2 per cent aged 20-24 and 17.0 per cent aged 25-29 compared to 14.0 per cent for men in each of the respective age groups).

Table 7.3
Percentage of youth by completion of post-secondary school education by age by sex, 2014

## Census

| Sex/Age group | Total persons* | Diploma <br> (\%) | University/ college (\%) | Post-graduate and above (\%) | Vocational training | Total \% with higher education |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Both sexes |  |  |  |  |  |  |
| 20-24 | 4,313,430 | 0.6 | 14.8 | 0.4 | 0.3 | 16.1 |
| 25-29 | 4,124,850 | 0.4 | 14.4 | 0.6 | 0.1 | 15.5 |
| Male |  |  |  |  |  |  |
| 20-24 | 2,079,579 | 0.7 | 12.7 | 0.2 | 0.3 | 14.0 |
| 25-29 | 1,981,022 | 0.6 | 12.8 | 0.5 | 0.2 | 14.0 |
| Female |  |  |  |  |  |  |
| 20-24 | 2,233,851 | 0.6 | 16.7 | 0.6 | 0.3 | 18.2 |
| 25-29 | 2,143,828 | 0.3 | 15.9 | 0.8 | 0.1 | 17.0 |

* Total excludes those with 'other' as the highest level of education.

The proportion of people completing higher education has been increasing steadily over time. In the 2014 Census, older cohorts had smaller proportions reporting completing higher education for both sexes as shown in Figure 7.2

Chapter 7. Transition from school to work for youth

Figure 7.2
Completion of higher education among older adult cohorts, 2014 Census

Table 7.4 shows that urban youth are more than three times as likely to have completed some higher education as rural youth. Even the absolute numbers of youth with higher education are much greater in urban areas. The table highlights only the age groups 20-24 and 25-29 because many aged 15-19 at the time of the Census would have been too young to have completed a higher educational level.

Table 7.4
Completion of higher education among the older youth, urban and rural areas, 2014 Census

| Age group | Percentage of youth with <br> higher education |  | Number of youth with <br> higher education |  |
| :--- | ---: | ---: | ---: | :---: |
|  | Urban | Rural | Urban | Rural |
| $20-24$ | 29.4 | 9.4 | 429,257 | 267,348 |
| $25-29$ | 30.4 | 8.6 | 400,504 | 240,866 |

Later sections will explore youth economic activity. It is important to note that the Census did not collect information on the quality of higher education, nor was any attempt made to verify diplomas or certificates during enumeration. Also, young people who had started college or university were recorded as having higher education even if they had not completed the entire degree. Many of those who reported completion of higher education also reported that they were still full-time students, which will be shown in more detail in Section 7.5.

### 7.3 Participation of youth in the labour force

### 7.3.1 Labour force participation rates

Chapter 6 described children at school and work. This section focuses on the transition of youth into the labour force from the age of 15 up to 24 (or 29). However, to fully understand the path from child labour to economically active adulthood, it is necessary to start at age 10, the youngest age at which the Census recorded economic activity. The question on economic activity status was asked in the Census of persons both in institutions and conventional households.

## Chapter 7. Transition from school to work for youth

Figure 7.3 shows the trend in labour force participation from ages 10-29 for males and females. Some 60.0 per cent of males and 44.2 per cent of females aged 15-19 were in the labour force. That is, they were either working (as employees, employers, own account workers or as unpaid workers in the family business) or seeking work. The rate continues to increase throughout their twenties for males, reaching 92.3 per cent in the last age group. The labour force participation rate for females increases to 59.7 per cent at ages 20-24 but then levels drop off and even decline slightly to 57.7 per cent at ages 25-29. Table 7.5 shows that for both sexes and at every age, the participation rates are higher in rural than in urban areas (see also Appendix 2, Table A2.28).

Figure 7.3
Child and youth labour force participation rates by sex by age, 2014 Census

## Chapter 7. Transition from school to work for youth

## Table 7.5

Child and youth labour force participation rates by sex by age, urban and rural areas, 2014 Census

| Sex/ Age group | Union |  | Urban |  |  | Rural |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Working | Seeking work | In labour force | Working | Seeking work | In labour force | Working | Seeking work | In labour force |
| Both sexes |  |  |  |  |  |  |  |  |  |
| 10-14 | 10.6 | 1.5 | 12.1 | 6.5 | 1.1 | 7.6 | 12.1 | 1.7 | 13.8 |
| 15-19 | 46.8 | 5.3 | 52.1 | 37.4 | 4.6 | 41.9 | 51.1 | 5.6 | 56.7 |
| 20-24 | 66.2 | 6.2 | 72.5 | 61.4 | 7.4 | 68.8 | 68.7 | 5.6 | 74.3 |
| 25-29 | 70.8 | 3.6 | 74.4 | 68.7 | 4.4 | 73.1 | 71.8 | 3.2 | 75.0 |
| 15-24 | 56.2 | 5.7 | 61.9 | 49.4 | 6.0 | 55.3 | 59.5 | 5.6 | 65.1 |
| 15-29 | 60.8 | 5.0 | 65.9 | 55.4 | 5.5 | 60.9 | 63.4 | 4.8 | 68.3 |
| Male |  |  |  |  |  |  |  |  |  |
| 10-14 | 11.1 | 1.8 | 12.9 | 7.2 | 1.4 | 8.6 | 12.6 | 2.0 | 14.5 |
| 15-19 | 53.6 | 6.5 | 60.0 | 43.4 | 5.9 | 49.3 | 58.4 | 6.7 | 65.1 |
| 20-24 | 79.3 | 6.8 | 86.1 | 72.6 | 8.0 | 80.6 | 82.8 | 6.1 | 89.0 |
| 25-29 | 88.1 | 4.2 | 92.3 | 84.9 | 5.4 | 90.2 | 89.5 | 3.7 | 93.3 |
| 15-24 | 65.9 | 6.6 | 72.5 | 57.7 | 7.0 | 64.7 | 69.9 | 6.4 | 76.4 |
| 15-29 | 72.8 | 5.9 | 78.7 | 66.0 | 6.5 | 72.5 | 76.1 | 5.6 | 81.7 |
| Female |  |  |  |  |  |  |  |  |  |
| 10-14 | 10.1 | 1.2 | 11.3 | 5.7 | 0.7 | 6.4 | 11.7 | 1.4 | 13.1 |
| 15-19 | 40.1 | 4.1 | 44.2 | 31.2 | 3.1 | 34.4 | 44.1 | 4.6 | 48.7 |
| 20-24 | 54.0 | 5.7 | 59.7 | 50.8 | 6.8 | 57.6 | 55.6 | 5.1 | 60.7 |
| 25-29 | 54.8 | 2.9 | 57.7 | 53.5 | 3.5 | 56.9 | 55.4 | 2.7 | 58.1 |
| 15-24 | 46.9 | 4.9 | 51.8 | 41.2 | 5.0 | 46.2 | 49.6 | 4.9 | 54.5 |
| 15-29 | 49.4 | 4.3 | 53.7 | 45.1 | 4.5 | 49.6 | 51.5 | 4.2 | 55.6 |

The labour force participation of youth has increased since the 1983 census (Immigration and Manpower Department, 1986, Table A-10). Table 7.6 shows that in the three decades between the two censuses, the participation of males and females aged 15-19 increased by at least 8 percentage points. The participation rates of older youth aged 20-29 increased by over 10 percentage points for males, and jumped to 18 percentage points for females.

Table 7.6
Labour force participation rates for youth by sex by age, 1983 and 2014 censuses

| Age group | Male |  | Female |  |
| :--- | ---: | ---: | ---: | ---: |
|  | $\mathbf{1 9 8 3}$ | $\mathbf{2 0 1 4}$ | $\mathbf{1 9 8 3}$ | $\mathbf{2 0 1 4}$ |
| $15-19$ | 48.3 | 60.0 | 35.8 | 44.2 |
| $20-29$ | 78.7 | 89.1 | 40.3 | 58.7 |

### 7.3.2 Starting work

It is not possible to extract from the Census data a clear picture of what proportion of youth are going to school and not working, or working and not going to school, or those who are combining school and work. This is because, as noted in Chapter 6, the questions on economic activity and school attendance referred to different timeframes. The Census took place during the end of the school year break. Enumerators, who were mostly teachers, were told to count a child as a student if he or she was attending in the school year that had

## Chapter 7. Transition from school to work for youth

just finished. Labour force participation was, however, calculated by asking about the main activity in the 12-month period prior to the Census. If a youth was going to school or college and working part-time or seasonally, his or her main activity would have been listed as 'fulltime student' as only one response was permitted to the activity question.

For those who had just left school and were moving into the workplace, the average age of beginning employment derived from the Census is artificially high. A 15-year old who had completed his/her school in the school year that had just finished and was now working fulltime, would be classified as a full-time student and not a worker, even though he/she had started work at the age of 15 . At the same time, a 16 -year old worker who had left school the year before would be classified as a worker. This difference is not a major problem for older youth and adults but presents an upward bias in the ages of students and workers at ages 14-17 when young people are rapidly changing their economic activity status. Their responses given in the Census referred to their usual/main activity status rather than their current activity status.

Figure 7.4 (and Appendix 2, Table A2.28) shows the proportion of all young people aged 10-29 who were working by single year of age. By their late twenties, around 70 per cent of youth were employed, with this proportion being higher for males ( 90 per cent) than females (about 55 per cent). The percentage of employed females peaks at 56 per cent at age 25 and declines slightly to 54 per cent by age 29. The Census also reported higher proportions employed in rural areas indicating that rural children and youth generally start working at much younger ages than their urban peers, as illustrated at Figure 7.5.

Figure 7.4
Percentage of children and youth who were employed by sex by age, 2014 Census

Chapter 7. Transition from school to work for youth

Figure 7.5
Percentage of children and youth who were employed by sex by single year of age, urban and rural areas, 2014 Census

The proportions of children and youth employed can be used to estimate a mean age of starting employment, among those who will be in the labour force (Bernard et al, 2014; Hajnal, 1953). This method is similar to the one used to estimate the average age of marriage from the Census data and is explained in Chapter 8. It calculates the average number of years spent not working up to age 29. The proportion employed at age 30 is used as the estimate of the proportion of children and youth who will ever have employment. The estimated singulate mean age at employment is shown at Table 7.7. The average ages of starting work, of those who can be expected to ever work, are younger for rural males and females. Note once again that main activity here refers to the 12 -month period prior to the Census rather than the current status at the time of the Census, so these median ages are likely to overstate the age of starting work by an average of six months.

## Table 7.7

Singulate mean age of starting work*, urban and rural areas, 2014 Census

| Sex | Union | Urban | Rural |
| :--- | ---: | ---: | ---: |
| Male | 17.0 | 18.0 | 16.5 |
| Female | 14.4 | 16.5 | 14.8 |

*Average age of starting employment for those children and youth who will join the labour force by age 30.

### 7.3.3 Youth unemployment

An unemployment rate is the number of persons unemployed and seeking work divided by the entire labour force of those employed and unemployed. Globally, unemployment rates are higher among youth than for older adults. This is because youth generally lack the skills, experience, networks and track record necessary to gain work (World Bank, 2006). Figure 7.3 and Table 7.5 above include the percentage of youth who are not working but are seeking work. This amounts to 6.2 per cent of those aged 20-24 and 3.6 per cent of those aged 25-29. Males at these ages have higher proportions seeking work than females; and the proportions are consistently lower in rural areas but show the same sex/age-specific pattern as in urban areas.

Chapter 7. Transition from school to work for youth

Table 7.8 shows, however, that the youth unemployment rate (for 15-24 year olds) overall is 9.3 per cent, and that unemployment is more prevalent in urban than in rural areas ( 10.8 per cent compared to 8.6 per cent), and, to a lesser degree, higher among females than males ( 9.5 per cent compared with 9.1 per cent). The periods when young people are transitioning from education to employment are associated with higher rates of unemployment - children aged 10-14, who would be leaving primary and lower secondary school, and 20-24 year olds completing higher education. However, these figures should be interpreted with caution. The Census is likely to underestimate the true extent of unemployment because it asked about the main activity in the 12 -month period prior to the Census. Shorter periods of unemployment prior to the Census would not have been recorded.

Table 7.8
Youth unemployment rates by sex by age, urban and rural areas, 2014 Census

| Sex/Age group | Union | Urban | Rural |  |
| :--- | ---: | ---: | ---: | :---: |
| Both sexes |  |  |  |  |
| $10-14$ | 12.5 | 14.3 | 12.1 |  |
| $15-19$ | 10.2 | 10.9 | 9.9 |  |
| $20-24$ | 8.6 | 10.7 | 7.6 |  |
| $25-29$ | 4.8 | 6.0 | 4.2 |  |
| $15-24$ | 9.3 | 10.8 | 8.6 |  |
| $15-29$ | 7.7 | 9.0 | 7.1 |  |
| Male |  |  |  |  |
| $10-14$ | 14.1 | 16.5 | 13.5 |  |
| $15-19$ | 10.8 | 12.0 | 10.3 |  |
| $20-24$ | 7.9 | 10.0 | 6.9 |  |
| $25-29$ | 4.6 | 5.9 | 4.0 |  |
| $15-24$ | 9.1 | 10.8 | 8.4 |  |
| $15-29$ | 7.5 | 8.9 | 6.8 |  |
| Female |  |  |  |  |
| $10-14$ | 10.5 | 11.0 | 10.5 |  |
| $15-19$ | 9.4 | 9.1 | 9.4 |  |
| $20-24$ | 9.5 | 11.7 | 8.5 |  |
| $25-29$ | 5.0 | 6.1 | 4.6 |  |
| $15-24$ | 9.5 | 10.8 | 8.9 |  |
| $15-29$ | 7.9 | 9.1 | 7.5 |  |

Youth unemployment rates have increased since the last census, more so in some age groups. In 1983, the percentage of youth seeking work among all youth in the labour force was just 3.9 per cent for 15-19 year olds and 2.7 per cent for 20-29 year olds (Immigration and Manpower Department, 1986). In 2014, it was 10.2 per cent for 15-19 year olds and 6.7 per cent for 20-29 year olds (derived from numbers given in Appendix 2, Table A2.28).

Myanmar's youth unemployment rate ranks around the average of the ASEAN countries shown at Figure 7.6. Many factors can influence the extent of youth employment including the size and growth of the economy and the availability of employment suitable for unskilled youth. As shown elsewhere in this chapter, the high proportion of youth working in the informal economy and in low skilled occupations means that most youth in Myanmar can find work.

## Chapter 7. Transition from school to work for youth

Figure 7.6
Youth unemployment rate for 15-24 year olds in Myanmar and other ASEAN countries

Source: ESCAP Statistical Database for other ASEAN countries. Data refers to 2013, the last year available.

In Myanmar unemployment is positively correlated with levels of education. Table 7.9 shows this relationship for youth aged 20-24. As reported in the Census, youth with lower levels of completed education were much less likely to be reported as spending the previous 12 months seeking work. Males were more likely to be unemployed than females at every level of educational attainment up to, and including, upper secondary school. Among youth with higher education, females had higher levels of unemployment than males.

Rural females aged 20-24 with higher education have a particularly high level of unemployment (20 per cent), demonstrating the lack of employment options for highly educated people, and especially women, in rural areas. One possible factor is that these highly-educated young women had rejoined their family on completion of their education, or had accompanied a husband to a rural area, and were not able to find work locally. The unemployment of highly educated males and females, regardless of the reasons, represents an underutilization of skills which are badly needed for future economic development.

## Chapter 7. Transition from school to work for youth

Table 7.9
Percentage of youth aged 20-24 who were unemployed by highest level of educational attainment by sex, urban and rural areas, 2014 Census

| Area/Sex | Total persons | No education | Incomplete primary | Complete primary | Incomplete lower secondary | Complete lower secondary | Incomplete upper secondary | Complete upper secondary | Higher education |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Female | 5.2 | 2.2 | 3.0 | 2.7 | 3.4 | 4.1 | 5.4 | 6.2 | 20.0 |

* Excludes those with 'other' as the highest level of education.

### 7.3.4 Type of youth employment

Figure 7.7 illustrates the employment profile of males and females in urban and rural areas. It clearly shows that Government employment starts at age 18 and rises gradually with age. Private employment starts as early as age 10 and increases more rapidly throughout the teenage years, particularly in urban areas (see Appendix 2, Table A2.29). The prevalence peaks in the early twenties in rural areas. Young women start retreating from private employment in their early twenties, particularly in urban areas. Males increasingly work as own account workers as they grow older in both rural and urban areas. This trend is less pronounced for females. Being an unpaid family worker remains common for rural males and females throughout their twenties. Unemployment declines in the late twenties.

### 7.4 Returns from education

In this section youth's education and employment are brought together. Expanding opportunities for education, and the emergence of a more open and diverse economy, are giving youth and their parents more choices. The decision to continue with basic schooling and to pursue higher education is made with imperfect knowledge about the jobs that are available. Of course, future employment is not the only reason for study. As schools become more widely accessible and the quality of education improves, more children will continue through to secondary school as a matter of course.

Chapter 7. Transition from school to work for youth

This section first looks at the outcomes of educational attainment for today's youth by looking at their main economic activities. The occupations in which youth are working, the industries employing them, and the educational attainment required to gain employment in these fields are then examined.

### 7.4.1 Main economic activities and educational attainment

In many countries youth find it difficult to find employment. This may result in them becoming discouraged and withdrawing from the labour force. Table 7.10 gives an overview of this phenomenon in Myanmar. The Census showed that male youth had a NEET rate (those not in employment, education or training) of 10.6 per cent at ages 15-19. This declined slightly with age. In contrast, female youth started with a much higher NEET rate ( 22.9 per cent) and this increased with age. However, adjusting the female NEET by considering household work as productive domestic work (referred to here as 'home production'), brings the rate down to a level that is lower than that of males.

## Table 7.10

Percentage of youth not employed and not in education or training (NEET) by age by sex and (for females) adjusted for home production, urban and rural areas, 2014 Census

| Sex/Age <br> group | Union | Urban | Rural |
| :--- | ---: | ---: | ---: |
| Male |  |  |  |
| $15-19$ | 10.6 | 11.9 | 10.0 |
| $20-24$ | 8.2 | 9.5 | 7.5 |
| $25-29$ | 7.0 | 8.4 | 6.3 |
| $15-24$ | 9.5 | 10.7 | 8.9 |
| Female |  |  |  |
| $15-19$ | 22.9 | 20.5 | 24.0 |
| $20-24$ | 34.8 | 33.0 | 35.7 |
| $25-29$ | 41.7 | 42.0 | 41.6 |
| $15-24$ | 28.7 | 26.8 | 29.6 |
| Female (adjusted for home production) |  |  |  |
| $15-19$ | 4.6 | 4.5 | 4.7 |
| $20-24$ | 3.9 | 4.1 | 3.8 |
| $25-29$ | 3.3 | 3.6 | 3.1 |
| $15-24$ | 4.3 | 4.3 | 4.3 |

Separately identifying, among the economically inactive youth, those who can be classified as NEET, Table 7.11 presents the main activity status of those aged 20-24 by level of education. The first noticeable result is that those who have no reported educational attainment or with incomplete primary education have the highest rate of not being either employed or studying/training. This is in contrast to the higher rate of employment of children who had no education shown in Chapter 6. It appears that as these children grow older, there is less work available for them.

The second notable finding is that for females the likelihood of being employed is greater for those who have completed primary school than for those who dropped out. This shows that becoming economically active is not the only motivation for girls to leave school before

## Chapter 7. Transition from school to work for youth

finishing primary school. As will be discussed in Chapter 8, girls with less education are more likely to marry young, and those who are married are less likely to be in the labour force. For males and females, higher educational attainment is associated with lower employment rates. However, youth in higher education have the lowest NEET rate because many reported being full-time students rather than being unemployed.

Table 7.11
Percentage of youth aged 20-24 by sex by main activity status by highest level of educational
attainment, 2014 Census

| Sex/Activity status | Total | No education | Incomplete primary | Complete primary | Incomplete lower secondary | Complete lower secondary | Incomplete upper secondary | Complete upper secondary | Higher education |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

### 7.4.2 Occupation, industry and educational attainment

This section presents the main occupational groups and industries in which youth are employed. It then explores occupations and industries of youth by their educational attainment. The main question to answer is whether or not continuing education beyond primary school brings new employment opportunities at this stage of Myanmar's development.

Information on occupation and industry was only collected in the 2014 Census for people in conventional households who were reported in the main activity question as working. That is, the tables do not cover people who were unemployed or who were living in an institution.

The distribution by occupation shown at Figure 7.8 (and detailed in Appendix 2, Table A2.30) reflects the economic structure of the country, which is primarily agricultural. The overall occupation pattern is one of continuity from age 10 to 29, particularly in rural areas, suggesting that, with relatively few alternatives within the economy, once a young person takes up a particular occupation, he or she is likely to remain in it.

## Chapter 7. Transition from school to work for youth

The profiles in rural and urban areas have pronounced differences and, within these areas, there are differences between males and females. Agriculture is the dominant occupation in rural areas, followed by elementary occupations between the ages of 12 and 17 . Many of the children whose occupations were 'not stated' may also have been doing such unskilled work. In urban areas, from the age of 21 , a fifth of young women who were working were in management, professional or clerical jobs. This proportion reached 28 per cent by age 29. Many other girls and young women were working in service occupations and this proportion slightly increases over the years. Boys in urban areas up to age 12 tended to be working in services. Working in crafts and trades was the most common occupation among urban males after the age of 12 .

b) Female Union

## Chapter 7. Transition from school to work for youth

## c) Male Urban

d) Female Urban

## Chapter 7. Transition from school to work for youth

e) Male Rural

f) Female Rural

Figure 7.9 examines the relationship between occupation and highest educational attainment in urban and rural areas. (Appendix 2, Table A2.31 presents the detailed results by sex and at the Union level). There are several points of interest. Firstly, the dominance of agricultural work in rural areas is clear. At the time of the Census more than half of all rural employed youth were working in agricultural occupations, though among those with post-secondary education only one in five did so. Secondly, there is a concentration of managerial, professional, technical and clerical jobs among urban youth with higher education. Collectively, these jobs were held by almost half of highly educated urban youth but by only 12 per cent of urban youth who had completed high school. Thirdly, in both urban and rural areas the proportion of youth employed in services and sales increased with education level and the proportion employed in elementary occupations declined. Fourthly, there was a relatively small difference in the occupations between those who completed and did not complete primary school and secondary school. The fact that completing a level of schooling does not lead to a better occupation may be one of the reasons for the poor completion rates.

## Chapter 7. Transition from school to work for youth

Figure 7.9
Percentage of employed youth aged 15-29 by occupation by highest level of educational attainment, urban and rural areas, 2014 Census
a) Urban

b) Rural

Note: 'Not stated' refers to those cases where responses given to the question on occupation were either missing or did not provide sufficient information for the occupation group to be correctly identified.

A look at the industry profile shows a similar pattern. Not surprisingly, half of employed youth aged 15-29 ( 51.3 per cent of young males and 46.4 per cent of young females) were working in agriculture (Figure 7.10). The industry employing the next largest percentage of female youth was manufacturing ( 13.8 per cent) followed by trade 9.8 per cent. A full data set is presented in Appendix 2, Table A2.32.

Chapter 7. Transition from school to work for youth

Figure 7.10
Percentage of employed youth aged 15-29 by sex by industry, 2014 Census

Note: 'Not stated' refers to those cases where responses given to the question on industry were either missing or did not provide sufficient information for the industry group to be correctly identified.

To explore the relationship between industry and education, Figure 7.11 shows the profile of the proportion of youth working in selected industries (mining and quarrying; manufacturing; construction; and trade) by level of education completion. The peaks at grade five show high proportions of youth who left school after completing primary school. Youth working in mining were more likely to have only completed primary school compared to those working in other industries, while young workers in manufacturing were more likely to have completed only lower secondary school (Grade 9). However, these differences are not large, reflecting no more than a couple of percentage points. The only large difference was in the trade sector, which encompasses a wide range of industries such as wholesale and retail trade and the repair of motor vehicles and motorcycles. Youth working in trade were almost twice as likely as those working in other industries to have completed Grade 11 or to have gone on to higher education.

Chapter 7. Transition from school to work for youth

Figure 7.11
Percentage of youth aged 15-29 employed in selected industries by highest grade completed, 2014 Census

### 7.5 Young women's work

The previous sections have already highlighted major differences between male and female educational attainment and employment. Key findings were that girls were slightly less likely to complete every level of basic education except upper secondary/high school. When they had graduated from high school, they were more likely to continue on to higher education, but they had slightly lower employment rates and a higher likelihood of being unemployed if they did continue onto higher education.

Rising educational attainment and declining fertility have enabled young women to participate in the labour force in greater proportions than at the time of the 1983 census. They are now taking up jobs in modern sectors of the economy. However, paradoxically, those who go on to higher education face higher rates of unemployment than young women with less education, and somewhat higher rates compared to males with the same education. They are more than twice as likely not to be in education and/or employment than males with the same education (see Table 7.11 above).

As working children, boys and girls have very similar employment patterns: they have equal rates of child labour force participation and work in similar occupations. This pattern changes as they grow older. Most importantly, young women start to withdraw from the labour force. By age 29 only 54 per cent of young women were reported as employed, compared to 90 per cent of young men of the same age (Appendix 2, Table A2.29). This is due to a combination of social factors which discourage some young women from pursuing employment opportunities and the obligations to devote time to family life and home production. These will be discussed in more detail in Chapter 8, which examines the effect of marriage and children on young women's labour force participation.

The 2014 Census did not ask young women why they did not participate in the labour force, but it does show that women remain active even if they are out of the labour force because

## Chapter 7. Transition from school to work for youth

of their household work or home production duties. An adjusted labour force participation rate reflects this important role. As Table 7.12 shows, when home production is considered, female labour force participation is greater than that of males.

Table 7.12
Labour force participation rate for children and youth by sex, and (for females) adjusted rate, by age, urban and rural areas, 2014 Census

### 7.6 Summary

Today's youth are better educated than any previous cohorts. They are embracing opportunities for education, especially those in urban areas where the education facilities and employment opportunities are located. Importantly, there are few if any disparities in basic education. Nevertheless, there are huge differences in the education and employment patterns of rural and urban youth.

Employment in rural areas is dominated by agriculture and elementary occupations. Overall, female youth are less likely to be in the labour force than male youth. The participation rate peaks for females at ages 20-24, at 60 per cent. It then begins to decline. This movement out of the workforce is accompanied by a movement into home production. However, when adjusted for home production, the labour force participation rate of female youth is not very different from, and in fact becomes slightly higher than that of male youth.

In urban areas, young men and women are increasing their chances for better employment by continuing on to higher education. Thirty per cent of urban youth aged 20-29 have received some post-secondary education. However, unemployment rates are highest amongst the higher educated. Women with higher education and who do work, are much more likely to be in managerial, professional, technical or clerical positions than their peers who have only completed secondary school.

At the other end of the scale, youth with no education or with incomplete primary education are more likely to be not employed or studying/training. Even manual industries such as mining and construction employ disproportionate numbers of youth with a level of education beyond primary school. Half a million youth are illiterate.

## Chapter 8. Starting a family

The previous chapters have examined how youth are transitioning to adulthood by studying, leaving the parental home to live independently, and taking up employment. This chapter focuses on youth starting their own families. It considers the decisions that young people make about marriage and childbearing. Of particular interest is how female youth are balancing marriage and labour force participation. The timing of these life events is affected by a number of factors including, but not limited to, cultural preferences for when young adults marry and where they live after marriage, economic opportunity and the availability of affordable housing.

### 8.1 Marriage

According to the Child Law of 1993 (2014 Amendment) the minimum age of marriage for males and females is 15 years old. However, marriage is governed primarily by customary law and practices vary by area and religion (MNPED and UNICEF, 2012). Before analyzing the proportions of youth who are married, it is necessary to review how marriage was recorded in the 2014 Census.

### 8.1.1 Census recording of marital status

The 2014 Census reported marital status for all persons aged 10 and over (See Q6 at Appendix 1), but all children aged 10-14 were recorded as single (never married). Marriages involving girls under 15 years are rare, but they most likely exist even though the Census did not attempt to record them. Indeed, from the information collected on relationship to household head, the Census reported that 7,972 people aged 10-14 ( 0.2 per cent) were recorded as a 'spouse'.

Data on marital status in Myanmar censuses and surveys include a 'renounced' category. Almost all of youth who are reported as 'renounced' ( 98 per cent) were living in institutions such as monasteries and other religious establishments. Many Buddhist parents in Myanmar send their sons, and sometimes their daughters, to a religious order for a period ranging from days to months. The holiday period (during which the 2014 Census was taken) is a popular time to fulfil this obligation. However, such activity does not mean that young people are expected to join a religious order permanently. Older people, from age 20, can make the decision to become a monk or nun. Some of these people may do this after having married, hence 'renouncing' their former married life. Others will have never married; becoming a monk or nun is 'renouncing' the opportunity to marry.

Figure 8.1 shows the proportion of 'renounced' males and females by single year from age 15 to 49 . The high numbers of male youth reflect the practice of receiving religious instruction while young. By age 25, the proportion of males who are 'renounced' has settled at a level just above 1.5 per cent, increasing slightly later in life. Females exhibit a much more even pattern at each age and at a much lower rate.

For the purposes of examining the trend in marital status, renounced males and females below the age of 30 are assumed to have never been married. Half of those in their thirties and all of those aged 40 and over are assumed to have been previously married.

## Chapter 8. Starting a family

Figure 8.1
Percentage of population aged 15-49 reported as 'renounced' by sex by age, 2014 Census

### 8.1.2 Proportions marrying or remaining single

Figure 8.2 shows the proportions of males and females by marital status from ages 15 to 49 by single years. The data from which these graphs are generated are set out in Appendix 2, Table A2.33. There are a number of interesting features about these graphs. Firstly, the proportions of females married increases quite rapidly from age 15, and particularly after the age of 17. For males, the proportions married do not start to increase until they are in their early twenties. Secondly, the Census reported that there was a fairly large proportion of females in their forties who have never married; by age 49 this was 12.4 per cent. It is less common for males of that age not to have been married (just 7.4 per cent).

The 2014 Census thematic report on Fertility and Nuptiality (Department of Population, 2016d) notes that a high proportion of women in Myanmar remain single. Just under 12 per cent of women aged 50-54 were reported as never married in the 2014 Census. In 1983, only 5.9 per cent of women that age had never married.

## Chapter 8. Starting a family

Figure 8.2
Percentage of population aged 15-49 by marital status by sex by age, 2014 Census
a) Male

b) Female

A similar increase in the proportion of women never marrying has occurred in many East and South-East Asian countries and has been attributed to several reasons. The first is the collapse of the arranged marriage system along with the absence of alternative ways to meet and court potential marriage partners (Jones, 2007). The 2004 Family and Youth Survey asked youth who should make the decision about a marriage partner (Department of Population and UNFPA, 2009). Among male youth, two thirds (68 per cent) said that they themselves had made the decision, and 29 per cent said that their parents had, whereas females were evenly split both with a 48 per cent response.

The second reason, as Table 8.1 shows, is that high proportions of never married are more common among young women living in cities and towns. In addition, the Census showed that the proportions of males and females never married increased with level of education,

## Chapter 8. Starting a family

culminating in half of males and females who had post-secondary school education being unmarried at age 29 (Figure 8.3). In urban Myanmar, almost 19 per cent of women in their early forties had never married. A marriage squeeze may be at work here; that is, there are too few suitable men for them to marry. In urban areas, there are many well-educated women and a low sex ratio as discussed in Chapters 2 and 7. Young urban women have fewer potential husbands; the numbers are even less if they, or their potential husbands, believe that the man should have the same or higher level of education as the woman.

Thirdly, the high proportion of never married is culturally supported in Myanmar, where there is both the tradition of nuns and religious lay people, and an acceptability of women remaining with their family of origin to care for ageing parents.

Table 8.1
Percentage of females never married by age, urban and rural areas, 2014 Census

| Age group | Union | Urban | Rural |
| :--- | ---: | ---: | ---: |
| $15-19$ | 87.0 | 90.2 | 85.6 |
| $20-24$ | 54.7 | 65.2 | 49.3 |
| $25-29$ | 32.1 | 41.8 | 27.6 |
| $30-34$ | 20.8 | 27.1 | 18.0 |
| $35-39$ | 16.2 | 21.2 | 14.1 |
| $40-44$ | 14.1 | 18.7 | 11.9 |
| $45-49$ | 12.9 | 17.1 | 10.9 |
| $50-54$ | 11.9 | 15.9 | 10.1 |

Figure 8.3
Percentage of persons never married by selected ages by sex by highest grade completed, 2014

## Census

Chapter 8. Starting a family

Fourthly, economic factors are likely to influence this trend (Jones, 2007). Myanmar's economy has been stagnant for decades. Only very recently has it started to expand, but most employment in the government and private sector is either difficult to get into or is insecure. Section 8.3 shows that marriage and working outside of the home is still uncommon for married women in Myanmar. Potential marriage partners may choose to delay marriage or to never marry if it means relying on only the husband's income (Gender Equality Network, 2015).

### 8.1.3 Early marriage

There is a global movement to eliminate child marriages by encouraging the delay of first marriage until after the age of 18 - the age of majority in most parts of the world (UNFPA, 2012). Postponing marriage is beneficial for young women and for socioeconomic development. The greater responsibility that comes with marriage means that young women (and men) who marry in their teens or early twenties are less likely to continue their education and learn skills that will lead to decent wages and productive work. Older, better educated mothers are also more likely to have fewer children with a higher probability of survival. Very young brides are likely to have more high-risk pregnancies during adolescence. Furthermore, child marriage is a human rights issue; marriage should involve the free and full consent of both partners. Children, generally, do not have the maturity to give such consent.

As noted at the start of this chapter, the legal minimum age for marriage in Myanmar is 15. This means that according to the definition of a child being used in this report, there should be no child marriages in the country. But it has already been noted that from the information collected on relationship to the household head, the Census reported that 7,972 people aged 10-14 ( 0.2 per cent) were recorded as a 'spouse'. Moreover, using the international definition of a child as a person below the age of 18 , cases of 'child' marriages clearly occur. As can be seen from Table 8.2, some 1.4 per cent of children aged $10-17$ were reported as having ever been married in Myanmar, with this proportion being slightly higher in rural areas (1.6 per cent) than in urban areas (1.1 per cent) and generally higher for females ( 2.3 per cent) than for males ( 0.6 per cent). There was little variation across States/Regions. The proportion ever-married was highest among females in rural Shan (3.7 per cent) and lowest among males in urban Kayah and Tanintharyi ( 0.3 per cent).

## Chapter 8. Starting a family

| Bago | 1.5 | 1.2 | 1.5 | 0.6 | 0.6 | 0.6 | 2.4 | 2.0 | 2.5 |
| Magway | 1.3 | 1.1 | 1.3 | 0.6 | 0.6 | 0.6 | 1.9 | 1.7 | 2.0 |
| Mandalay | 1.2 | 1.0 | 1.3 | 0.6 | 0.5 | 0.7 | 1.8 | 1.6 | 2.0 |
| Mon | 1.2 | 1.0 | 1.3 | 0.5 | 0.4 | 0.5 | 1.9 | 1.7 | 2.0 |
| Rakhine | 1.4 | 1.4 | 1.4 | 0.4 | 0.6 | 0.4 | 2.4 | 2.3 | 2.4 |
| Yangon | 1.3 | 1.2 | 1.7 | 0.6 | 0.5 | 0.7 | 2.1 | 1.8 | 2.6 |
| Shan | 2.1 | 1.2 | 2.4 | 0.9 | 0.5 | 1.0 | 3.3 | 1.9 | 3.7 |
| Ayeyawady | 1.7 | 1.6 | 1.7 | 0.7 | 0.8 | 0.7 | 2.8 | 2.4 | 2.8 |
| Nay Pyi Taw | 1.7 | 1.3 | 1.8 | 0.7 | 0.6 | 0.7 | 2.7 | 2.0 | 2.9 |

Table 8.3 shows the proportions of youth aged 15-17 (that is, those under 18) and 15-19 who have ever-married (that is whose marital status in the Census was recorded as married, widowed or divorced/separated) for the Union and States/Regions. Early marriage is more common in rural areas than in urban areas and, of course, more common for females than males. Some 4.7 per cent of male adolescents aged $15-19$ were reported as ever-married; 3.6 per cent in urban areas and 5.2 per cent in rural areas. Among adolescent females, almost three times the proportion ( 13.0 per cent) were ever-married; 9.8 per cent in urban areas and 14.4 per cent in rural areas. In urban areas, the proportion of adolescent females evermarried ranged from 7.1 per cent in Chin to 13.4 per cent in Ayeyawady, while in rural areas, the range was from 11.2 per cent in Sagaing to 19.5 per cent in Shan.

| Tanintharyi | 5.3 | 12.1 | 4.1 | 9.2 | 5.7 | 13.0 |
| Bago | 6.7 | 13.9 | 5.4 | 11.2 | 7.1 | 14.7 |
| Magway | 5.5 | 11.2 | 4.4 | 9.0 | 5.7 | 11.6 |
| Mandalay | 4.9 | 10.6 | 3.9 | 8.8 | 5.5 | 11.7 |
| Mon | 5.8 | 12.0 | 4.7 | 10.2 | 6.3 | 12.7 |
| Rakhine | 7.2 | 15.4 | 6.3 | 12.8 | 7.4 | 15.9 |
| Yangon | 5.4 | 10.8 | 4.5 | 9.1 | 7.3 | 15.0 |
| Shan | 9.3 | 17.4 | 5.1 | 10.6 | 10.6 | 19.5 |
| Ayeyawady | 8.1 | 16.1 | 6.5 | 13.4 | 8.4 | 16.6 |
| Nay Pyi Taw | 7.6 | 16.1 | 5.3 | 12.4 | 8.5 | 17.7 |

As might be expected the prevalence of adolescent marriage varied more at the District level. The 28 Districts where at least 14.8 per cent of female youth aged 15-19 were evermarried are listed at Table 8.4 in ranked order. The rates for all Districts for those aged 15-17 and 15-19 are given in Appendix 2, Table A2.34.

## Chapter 8. Starting a family

Table 8.4
Districts with the highest proportions of females aged 15-19 ever-married, 2014 Census

| District | State/ Region | Percentage evermarried aged 15-19 | District | State/Region | Percentage ever-married aged 15-19 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Minesat | Shan | 31.2 | Hinthada | Ayeyawady | 16.7 |
| Minephyat | Shan | 26.8 | Kyaukme | Shan | 16.7 |
| Linkhe` | Shan | 24.3 | Kyaukpyu | Rakhine | 16.2 |
| Loilin | Shan | 22.9 | Pathein | Ayeyawady | 16.1 |

| Tachileik | Shan | 20.4 | Laukine | Shan | 15.2 |
| Phyapon | Ayeyawady | 18.3 | Dekkhina (South) | Nay Pyi Taw | 15.0 |
| Thayawady | Bago | 17.8 | Makman | Shan | 15.0 |
| Ottara (North) | Nay Pyi Taw | 17.4 | South Yangon | Yangon | 14.8 |

### 8.1.4 Average age at marriage

Using the proportions of single (never married) by age, an estimate of the average age at first marriage of those who will marry can be calculated. The singulate mean age at marriage (SMAM) is an indicator devised and used with census data on marital status by age and sex. SMAM is derived by adding the years spent single up to age 50 minus those years single by people who have not married by age 50, and divided by the proportions of those never marrying by age 50 (Hajnal, 1953) (see Glossary of terms and definitions).

The Union level SMAM is 26.3 for males and 23.6 for females. Table 8.5 shows the variation in age at marriage across States/Regions ranked by the female SMAM. Among females, the estimated age at first marriage of those who will marry ranges from 22.2 in Ayeyawady to 25.2 in Yangon. Estimated SMAM for males ranges from 25.0 (again in Ayeyawady) to 28.3 in Kachin.

Age at marriage has been increasing in Myanmar. The SMAM derived from the 1983 census was 24.7 for males and 22.4 for females. These were 1.6 and 1.2 years younger, respectively, than those estimated from the 2014 Census data.

The 2004 Family and Youth Survey asked a national sample of youth about the ideal age for males and females to marry (Department of Population and UNFPA, 2009). Table 8.6 shows that the ideal ages reported in that survey were a little lower for females in urban areas than the actual ages derived from the 2014 Census and much lower for males in both urban and rural areas.

## Chapter 8. Starting a family

## Table 8.5

Singulate mean age at marriage by sex, urban and rural areas, State/Region, 2014 Census

| State/Region/Area | Male | Female |
| :--- | :--- | :--- |
| UNION | $\mathbf{2 6 . 3}$ | $\mathbf{2 3 . 6}$ |
| Urban | 27.5 | 24.9 |
| Rural | 25.7 | 23.0 |
| Ayeyawady | 25.0 | 22.2 |
| Rakhine | 25.4 | 22.4 |

### 8.1.5 Characteristics of the young married

Around the world, child marriages are more prevalent in rural than in urban areas and among the poorest and least educated (UNFPA, 2012). The higher rates of ever-married adolescents aged 15-17 in rural Myanmar were shown at Table 8.3. More than 30 per cent of 18 year old females who had not completed primary school were married, compared to 20 per cent of those who had attended lower secondary (middle) school (Grade 9) (Figure 8.3).

Youth, who at the time of the Census were currently married, were more likely to be living in their own household as head or spouse of head, compared to unmarried youth (Table 8.7). However, the majority of currently married youth aged 15-19 live with parents or parents-in-

## Chapter 8. Starting a family

laws. Whereas a fifth of never married youth live in households headed by other relatives or non-relatives, this was true of about 11 per cent of 15-19 years old who were married and even fewer older married youth.

Table 8.7
Percentage of youth by marital status by relationship to head of household by sex by age, 2014

## Census

| Sex/Age group | Currently married |  |  |  | Never married |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total persons (=100\%) | Head or spouse of head | Son/daughter or son/daughter-in-law | Other relative or non-relative | Total persons (=100\%) | Head or spouse of head | Son/daughter or son/daughter-in-law | Other relative or non-relative |
| Male |  |  |  |  |  |  |  |  |
| 15-19 | 96,523 | 25.5 | 63.0 | 11.4 | 1,938,008 | 0.6 | 77.1 | 22.3 |
| 20-24 | 603,031 | 40.6 | 50.2 | 9.2 | 1,188,335 | 2.1 | 74.3 | 23.6 |
| 25-29 | 1,097,434 | 56.7 | 36.4 | 6.9 | 647,790 | 4.5 | 72.2 | 23.2 |
| 15-24 | 699,554 | 38.5 | 52.0 | 9.5 | 3,126,343 | 1.2 | 76.1 | 22.8 |
| 15-29 | 1,796,988 | 49.6 | 42.5 | 7.9 | 3,774,133 | 1.8 | 75.4 | 22.8 |
| Female |  |  |  |  |  |  |  |  |
| 15-19 | 281,621 | 31.8 | 58.1 | 10.2 | 1,924,625 | 0.6 | 76.2 | 23.2 |
| 20-24 | 951,788 | 46.8 | 45.5 | 7.8 | 1,124,097 | 1.7 | 73.7 | 24.6 |
| 25-29 | 1,368,316 | 60.6 | 33.6 | 5.8 | 632,556 | 3.6 | 73.5 | 22.9 |
| 15-24 | 1,233,409 | 43.3 | 48.3 | 8.3 | 3,048,722 | 1.0 | 75.2 | 23.8 |
| 15-29 | 2,601,725 | 52.4 | 40.6 | 7.0 | 3,681,278 | 1.4 | 74.9 | 23.6 |

Table 8.8 shows the differences in the wealth index profile among married and unmarried youth by sex and age.

For the never married (single), the highest proportions are in the highest wealth quintile and the lowest proportions are in the lowest quintile regardless of age and sex, though the gradient increases with age such that almost a third of never married young women aged 2529 ( 32.1 per cent) are in the highest quintile while only 9.3 per cent are in the lowest quintile. For the ever-married (those married, widowed, or divorced), the reverse is the case with higher proportions of both male and female youth belonging to the lowest household wealth quintile though the profile gradients are less pronounced.

See Appendix 3 for a description of the wealth index.

## Chapter 8. Starting a family

Table 8.8
Percentage of never married and ever-married youth by sex by age by wealth index quintile, 2014

## Census

| Marital status | Sex | Age group | Wealth quintile |  |  |  |  | Total |

## Chapter 8. Starting a family

### 8.2 Teenage fertility

Teenage fertility is an issue of international concern. The 2014 Census data reveals that, at the Union level, the fertility rate of females aged 15-19 was 33 births per 1,000 women. Figure 8.4 shows that the rate was much lower in urban areas (22) than in rural areas (38) and among States/Regions the level ranged from a low of 21 in Yangon Region to a high of 59 in Shan State, almost three times higher.

Figure 8.4
Adolescent fertility rate (15-19 years), urban and rural areas, State/Region, 2014 Census

Figure 8.5
Adolescent fertility rates for Myanmar and other ASEAN countries

Source: ESCAP Statistical Database for countries other than Myanmar derived from the United Nations Population Division 2015 Population Prospects.

Figure 8.5 shows that, compared to other ASEAN countries, Myanmar has a relatively low adolescent fertility rate, although it should be noted that the rates for other countries have been derived from population projections and assumptions about fertility trends.

Chapter 8. Starting a family

### 8.3 Managing marriage, children and work for young women

To explore why young women leave the labour force, Table 8.9 shows their main economic activity by whether they were single (never married), married without children or married with one or more children. The differences are stark. Never married women have a high labour force participation rate, especially after they finish their education. At the time of the Census, nearly four out of five never married women aged 25-29 were in the labour force in both rural and urban areas. This was almost as high as the labour force participation rates for young men of that age. The percentage reported to be doing household work in urban areas ranged from only 12.7 per cent for those aged 15-19 to 15.7 per cent for those aged 25-29 and from 15.8 per cent for those aged 15-19 to 17.2 per cent for those aged 25-29 in rural areas.

Being a full-time student is uncommon among young ever-married women, and particularly so if they have children. Women, seemingly, prefer to wait until they finish their education before they marry least their marriage interrupts their studies. The timing of these events cannot, however, be specifically determined from the Census.

## Table 8.9

Percentage of female youth who are never married, ever-married with and without children by age by main economic activity, urban and rural areas, 2014 Census

| Marital status/ Age | Urban |  |  |  |  | Rural |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total | In labour force | Full-time student | Household work | Other | Total | In labour force | Full-time student | Household work | Other |
| Never married |  |  |  |  |  |  |  |  |  |  |
| 15-19 | 592,372 | 32.6 | 50.4 | 12.7 | 4.3 | 1,332,415 | 47.7 | 31.8 | 15.8 | 4.8 |
| 20-24 | 424,418 | 66.7 | 13.7 | 15.1 | 4.5 | 699,758 | 71.0 | 6.8 | 17.5 | 4.7 |
| 25-29 | 249,084 | 78.2 | 1.9 | 15.7 | 4.2 | 383,580 | 77.3 | 0.8 | 17.2 | 4.6 |
| Ever-married, no children |  |  |  |  |  |  |  |  |  |  |
| 15-19 | 49,835 | 36.4 | 7.4 | 51.7 | 4.5 | 155,920 | 53.1 | 2.8 | 40.0 | 4.1 |
| 20-24 | 113,098 | 44.9 | 2.7 | 48.9 | 3.5 | 270,939 | 55.2 | 0.9 | 40.3 | 3.6 |
| 25-29 | 102,676 | 52.1 | 0.8 | 43.8 | 3.3 | 182,325 | 57.6 | 0.4 | 38.5 | 3.5 |
| Ever-married, with 1 or more children |  |  |  |  |  |  |  |  |  |  |
| 15-19 | 18,249 | 24.1 | 3.8 | 68.3 | 3.8 | 70,388 | 46.2 | 1.1 | 49.9 | 2.8 |
| 20-24 | 137,353 | 28.8 | 1.1 | 67.4 | 2.7 | 468,104 | 46.6 | 0.3 | 50.8 | 2.3 |
| 25-29 | 281,178 | 35.5 | 0.5 | 61.7 | 2.4 | 861,870 | 48.7 | 0.2 | 49.1 | 2.0 |

The largest withdrawal from the labour force occurs after marriage. Married women in their twenties with no children have labour force participation rates that are at least 20 percentage points lower than their unmarried peers. Their labour force participation rates are between 45 and 52 per cent in urban areas and 55 and 58 per cent in rural areas. Young married women with children have even lower labour force participation rates: about a third in urban areas and just less than a half in rural areas.

The low labour force participation among young married women, even those without children, has a firm social and cultural foundation. A qualitative study on gender found that women of all backgrounds expressed the belief that women should not be, or should be discouraged from, working after marriage (Gender Equality Network, 2015). The ideal is that the husband

## Chapter 8. Starting a family

should be able to support the family through his hard work and greater abilities. The wife's job is to maintain the house and other domestic responsibilities. It is acceptable for a wife to work if it is considered necessary, for example to earn extra money for the family, but it is considered an exception and not a desirable or permanent arrangement. Furthermore, work choices for married women are constrained because women need to conform to gender roles regarding relations with men and positions of responsibility and leadership.

The 2004 Family and Youth Survey asked a national sample of youth if married women should work outside of the home (Department of Population and UNFPA, 2006). The majority of young men and women in rural areas opposed it, as did over 45 per cent of those in urban areas (Table 8.10). Only about a quarter expressed outright approval, and 14 to 22 per cent said 'it depends'. Young urban women were the exception: over a third ( 35 per cent) approved of married women working outside of the home.

Table 8.10
Opinion of youth aged 15-24 regarding married women working outside the home for pay

|  | Union |  | Urban |  | Rural |  |

## Chapter 8. Starting a family

### 8.4 Summary

Like many South-East Asian countries, age at marriage is increasing in Myanmar. Most youth in their early twenties are not married: 54.7 per cent of females and 67 per cent of males aged 20-24 have never been married. The singulate mean age at marriage (SMAM), which represents the average age at marriage for people who will marry by age 50 if current marriage rates persist, is 23.6 for females and 26.3 for males. These were 1.2 and 1.6 years later than recorded in the 1983 census. Urban youth marry later than rural youth and, for both sexes, the higher the completed level of education, the less likely a youth is to have been married.

In recent decades an increasing proportion of women have not married at all. The 2014 Census reported that 27 per cent of urban women and 18 per cent of rural women aged 30 to 34 had never married. This phenomenon has occurred in other Asian countries and has been attributed to several cultural and economic changes which has made finding a marriage partner more difficult and increased the economic risks of marrying. Regardless of educational attainment, young women who are married but without children have a lower labour force participation rate than never married women; those who are married and have one or more children have the lowest labour force participation rates of all.

Despite the trend towards later marriage, child marriage and adolescent childbearing is still common in parts of Myanmar. Six per cent of girls aged 15-17 have been married. Girl child marriage is most common in Shan ( 9.3 per cent), Ayeyawady ( 8.1 per cent) and Nay Pyi Taw ( 7.6 per cent). There are 28 Districts ( 12 of them in Shan) where at least 14.8 per cent of girls aged 15-19 have been married. Ninety per cent of these young ever-married girls are living in a household headed by themselves or their husband ( 32 per cent) or with a parent or parent-in-law (58 per cent). They are much more likely to be living in a household in the lowest wealth index quintile than their unmarried peers.

Because child marriage is low and childbearing outside of marriage very rare, the adolescent fertility rate is low: 33 births per 1,000 women aged 15-19. The rates are highest in Shan and Chin.

## Chapter 9. Youth on the move

### 9.1 Introduction

Youth are the most mobile members of the community. They move in search of education and employment opportunities not available in the Townships and Districts where they were born. During their twenties is also the time of life when many people marry and start a family, prompting a move for affordable living arrangements and more permanent employment.

The 2014 Census thematic report on Migration and Urbanization (Department of Population, 2016c) found that, on average, migrants to urban areas were better off than non-migrants in those communities. They were more likely to be employed and to live in better quality housing. In most cases, they had completed a higher level of education.

This report will investigate this trend with a focus on youth. While the full extent of youth migration cannot be measured for a number of reasons (see Section 9.1.2 below), young migrants can be identified, and their characteristics and their reasons for migrating can be described.

### 9.1.1 Youth migration, national development and policies

Young people are better educated, have higher workforce participation rates and are relatively less unencumbered with other responsibilities than older adults. Consequently, they can make an enormous contribution to the national economy. Facilitating the free and safe movement of young people for employment has become an economic policy priority for most developing economies, including Myanmar (World Bank, 2006, 2014).

Over the last few years, the Ministry of Labour has adopted a multi-faceted strategy to address the twin challenges of employment and migration (World Bank, 2014). It has opened employment centres across the country to assist youth and the unemployed population to access both domestic and overseas job markets, and to register migrant workers who work in neighbouring Thailand - a phenomenon previously regarded as an illegal activity subject to heavy fines and punishment by law. Vocational education to better prepare youth who have not completed secondary school for the modern economy is a focus of planned reforms by the Ministry of Education (Tanaka et al, 2015).

Migration, both internal and international, also provides an important pathway to adulthood for youth. Migration enables young people to apply their education and early life experiences to determine where they can have the best future. Analysis of international patterns of the timing of migrations has found that it is closely related to the ages of other transitions: leaving school, starting employment and marriage (Bernard et al, 2014).

### 9.1.2 Concepts and definitions for internal migration

The 2014 Census asked eight questions in the conventional household questionnaire from which a great deal of information about residential mobility within Myanmar can be derived (see Appendix 1). The first question (Q11) asked where each person was born. The name of the Township was recorded, but in order to determine the urban or rural status of the place

Chapter 9. Youth on the move
of birth the enumerator also ascertained whether the birthplace within the Township was a ward (indicating an urban locality) or a village tract (indicating a rural settlement). This was recorded at Q12. The Township and urban/rural classification of the person's place of usual residence was similarly recorded at Q13 and Q14 where usual residence was defined as where the person had lived for six months or more or intended to stay for six months.

Those who had moved were asked in Q15 how many years they had lived in their current Township, and Q16 asked the person why they had moved to their current usual residence. A move from one house to another within the same Township was not considered as a move for migration purposes. The responses to the reason for move question were coded as:

- Employment/in search of employment
- Education
- Marriage
- Followed family
- Conflict
- Did not move
- Other.

In Q17 and Q18, the Township where they previously usually lived and its urban/rural classification was recorded.

These questions capture the complexities when analyzing migration. In particular, migrants can be defined as those moving to their current place of residence over any interval from just after birth to a period of one year before the Census. This is valuable for studying youth migration. The conventional method of defining a 'recent migrant' is anyone who changed their place of usual residence in the five-year period prior to the Census. However, five years is a long time in the life of a 15-year old, so in this chapter migrations in both the previous five years and one year before the Census are used to explore recent internal migration trends.

The migration questions, however, have two main limitations common with migration data from all population censuses generally. Firstly, (as noted above) only residential movement between Townships is recorded as a migration. Moving, for example, from a village tract to the largest town within the same Township was not recorded. Secondly, only two moves at most are captured - the move from place of birth to previous usual residence, and then to current residence. Thus persons who may often move between their place of birth (or family home) and other locations for a period of more than six months at a time (frequent migrants) were not recorded.

A further limitation is that the 2014 Census only recorded migration information for people living in conventional households. Since youth have the highest probability of living in an institution (as students for example) and since, in most cases, being in an institution involved a move from a former residence, the total amount of youth migration is underestimated. Despite these limitations, the Census provides a unique insight into a behaviour which is becoming a more common and significant part of Myanmar's youth transition to adulthood.

Chapter 9. Youth on the move

### 9.1.3 Concepts and definitions for international outmigration

Respondents in conventional households were asked if a former household member was living abroad. This was followed by a question about that member's relationship to the head of household, and the migrant's current age, year of departure and current country of residence (see Q40 at Appendix 1).

The total number of Myanmar people reported as living abroad is considered to be a significant underestimate for several reasons (Department of Population, 2017c):

- Householders may have been reluctant to report people who had travelled abroad without documentation.
- The entire household may have moved abroad, leaving no one to report them as migrants.
- The household respondents may have been unaware that a former household member was living abroad or did not consider the migrant to be a former member of their household.
- The migrant's former household may no longer have existed as an entity.
- The migrant had been living in an institution prior to travelling abroad and was therefore not reported.

Thus the extent of youth international migration is also underestimated from the data collected in the Census.

### 9.2 Internal migration of youth

This section examines youth migration within Myanmar using two measures. The first is lifetime migration, particularly between States/Regions. This is the most stable measure of migration, enabling migrants to be compared to those who have remained at their place of birth. The frequency of migration and the age at which people moved is measured through the proportion of youth who have changed their usual residence to a new Township in the more recent past (recent migration).

### 9.2.1 Lifetime migration

Figure 9.1 shows the percentage of children and youth (in conventional households) who were reported in the Census as lifetime migrants by type of move. By age 29 about a quarter of both males and females had moved away from their Township of birth. Somewhat over half of the moves were to another State/Region (see also Appendix 2, Table A2.35). Females in their late teens and early twenties were more likely than males to move, particularly to another State/Region. However, by their late twenties, males were slightly more likely to be lifetime migrants.

Among all youth aged 15-24 living in conventional households, 19.3 per cent were living in a Township that was not the one in which they were born (Figure 9.2). Altogether, more than half (57 per cent) of these youth had moved to another State/Region. But the ratio of interState to intra-State moves varies across the country. Appendix 2, Table A2.36 presents the numbers of male and female youth who were lifetime migrants by State/Region of birth and whether the move was within the same State/Region or to another.

## Chapter 9. Youth on the move

Figure 9.1
Percentage of lifetime migrants among children and youth by sex by age by type of move, 2014 Census
a) Male

b) Female

Figure 9.2 shows that youth born in the central part of the country, including for example Bago and Magway, known for its dry, hot climate and poor agricultural productivity, are proportionately, more likely than others to move to another State/Region. In addition, the Figure presents the States/Regions in the order of the increasing proportion of intra-State/ Region moves, and shows that young people from the more prosperous States/Regions are more likely to make such moves. The most extreme example is Yangon; one quarter of youth born in Yangon have moved to another Township within Yangon. Youth migrants whose birthplace is Yangon make up 19 per cent of all youth who are lifetime migrants.

Almost half of youth who had moved inter-State/Region, had moved to Yangon (Figure 9.3). Mandalay, which contains the country's second largest city, was the second most common destination, but was home to only 12 per cent of youth who had moved inter-State/Region since birth.

## Chapter 9. Youth on the move

Figure 9.2
Percentage of lifetime migrants among youth aged 15-24 by State/Region of birth by type of move, 2014 Census

Figure 9.3
Percentage distribution of lifetime inter-State/Region migrants aged 15-24 by State/Region of residence, 2014 Census

Yangon is the prime destination for the nearest, southern, States/Regions of Ayeyawady, Rakhine, Tanintharyi, Bago, Mon and Magway (Table 9.1). Youth born in the more northerly Sagaing were more likely to move to neighbouring Mandalay, while those born in Chin were, in turn, more likely to move to neighbouring Sagaing. Youth born in Kayah were most likely to move to Shan. The remainder of the States/Regions were themselves destinations for some migrants; although one quarter to one-third of inter-State/Region migrants from these States/Regions had moved to Yangon, while other migrants were dispersed across the country.

Chapter 9. Youth on the move

## Table 9.1

Percentage of youth aged 15-24 who were lifetime inter-State/Region migrants by State/Region of birth by State/Region of usual residence, 2014 Census

| State/Region of usual residence | State/Region of birth |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

| Chin | 0.3 | 0.0 | 1.2 | 0.0 | 0.0 | 0.1 | 0.4 | 0.8 | 2.7 | 0.3 | 0.4 | 0.2 | 0.1 | 0.2 | 0.1 | 0.1 |

In Myanmar, young people from urban areas are more likely to move between States/Regions than young people from rural areas. As shown in Table 9.2, over half of youth who have undertaken inter-State/Region lifetime migration were born in an urban area and mostly moved to an urban area. This is a large percentage against the backdrop that only 30 per cent of Myanmar's population live in urban areas. Higher levels of education and better economic positions are probably two factors that enable the greater mobility of urban youth. In all States/Regions, more than half of youth who migrated during their lifetime moved to an urban area. Table 9.3 ranks the States/Regions in the order of the proportion of urban-urban moves. It was only those born in Kayah and Nay Pyi Taw that reported less than 60 per cent of migrating youth moving to an urban area.

## Chapter 9. Youth on the move

Table 9.2
Percentage distribution of flow of youth lifetime inter-State/Region migrants between urban and rural areas, 2014 Census

| Current usual <br> resident | Birthplace |  | Total |
| :--- | ---: | ---: | ---: |

| Kachin | 41,713 | 57.9 | 11.8 | 11.7 | 18.7 | 69.6 | 30.4 |
| Yangon | 18,922 | 56.4 | 11.4 | 10.1 | 22.1 | 67.8 | 32.2 |
| Mon | 37,339 | 53.7 | 15.1 | 10.0 | 21.2 | 68.8 | 31.2 |
| Rakhine | 41,849 | 51.4 | 26.0 | 7.5 | 15.1 | 77.4 | 22.6 |
| Kayin | 8,528 | 45.8 | 16.1 | 10.3 | 27.8 | 61.9 | 38.1 |
| Kayah | 100,534 | 45.1 | 23.2 | 9.0 | 22.7 | 68.3 | 31.7 |
| Mandalay | 4,661 | 44.7 | 8.8 | 14.8 | 31.6 | 53.5 | 46.5 |
| Nay Pyi Taw | 12,312 | 40.7 | 18.2 | 10.0 | 31.2 | 58.9 | 41.1 |
| Bago | 123,250 | 40.5 | 24.0 | 8.2 | 27.2 | 64.5 | 35.5 |
| Ayeyawady | 217,526 | 39.4 | 33.9 | 5.7 | 21.0 | 73.4 | 26.6 |
| Magway | 109,013 | 35.6 | 34.8 | 6.0 | 23.7 | 70.3 | 29.7 |
| Sagaing | 82,643 | 34.4 | 29.4 | 6.0 | 30.2 | 63.8 | 36.2 |
| Chin | 13,853 | 29.6 | 38.5 | 4.7 | 27.2 | 68.1 | 31.9 |

*From birthplace to usual residence.
Notes: Percentages do not sum to 100 per cent because some persons whose birthplace or current usual residence could not be classified as urban or rural are not included. Migrants born outside of Myanmar are excluded.

Table 9.4 shows the type of area where youth lifetime inter-State/Region migrants were born. In Yangon and Nay Pyi Taw, at least 55 per cent of young migrants who had moved into the Region/Union Territory had come from an urban area. However, in all other States/ Regions, a half or more of young migrants had moved from rural areas.

Chapter 9. Youth on the move

| Nay Pyi Taw | 37,838 | 45.1 | 11.8 | 56.8 | 20.0 | 23.2 | 43.2 |  |  |  |  |  |  |  |  |  |  |  |  |

*From birthplace to usual residence.
Notes: Percentages do not sum to 100 per cent because some persons whose birthplace or current usual residence could not be classified as urban or rural are not included. Migrants born outside of Myanmar are excluded.

To explore if young people who moved within Myanmar improved their economic circumstances, the economic conditions and educational qualifications of youth aged 15 to 24 who had moved inter-State/Region are compared with the total youth population. Because of the great disparities between urban and rural children and youth with respect to a healthy environment, education and employment described in previous chapters of this report, the comparisons are made between those youth born in urban areas and those born in rural areas.

Figure 9.4 summarizes the household wealth distribution of lifetime inter-State/Region migrants measured by a wealth index (described in Appendix 3). Three quarters of urbanborn youth who had moved from one urban area to another ( 75.2 per cent) were in the highest wealth quintile - a proportion higher than for any other type of move. However, as with all of the information presented in this section, it is not possible to determine whether it is youth from better-off households who were more likely to move, thereby maintaining their higher wealth status after the move, or whether young people were able to improve their household wealth as a result of their migration. The details by sex and type of migration flow are presented in Appendix 2, Table A2.37.

Figure 9.4 also shows that not all moves are necessarily beneficial. Young people born in urban areas, who at the time of the Census were living in a rural area, were living in more disadvantaged circumstances than those who moved from one urban area to another (only

Chapter 9. Youth on the move
42.8 per cent were in the highest wealth quintile). However, these young people were still better off than rural-born migrant youth of whom only 8.7 per cent were in the highest quintile, and of whom almost half ( 48.7 per cent) were in the lower two quintiles. Urban to rural migrants appear to take their urban advantage with them when they move to a rural area.

But rural-born youth who had moved into an urban area improved their household wealth conditions greatly, comprising 61.1 per cent of the highest quintile. Those who had moved to another rural area also improved their wealth status making up 20.9 per cent of the highest quintile, compared with 8.7 per cent of the total rural-born youth.

Figure 9.4
Percentage of urban- and rural-born youth lifetime migrants by type of migration by wealth index quintile of youth's household, 2014 Census

Using different measures of comparison, Table 9.5 contrasts the experiences of urban- and rural-born youth who had moved from their birthplace to another State/Region by selected characteristics covering marital status, main economic activity, educational attainment, and industry of employment, and compares these with the characteristics of non-migrant youth. The results reinforce the benefits of migration for most young people. However, this should not detract from the fact, which cannot be explored using the Census data, that some young migrants experienced forced employment and trafficking (Rogovin, 2015).

As shown earlier in this report, urban youth are generally much better educated than rural youth. Table 9.5 shows that this is also the case for inter-State/Region migrant youth. Among urban-born migrants, the proportions of those with higher education attainment, both for migrants to urban and to rural areas in another State/Region ( 26.0 per cent and 15.3 per cent respectively), were two times higher than their rural-born peers ( 12.8 per cent and 6.7 per cent). At the other end of the educational scale, more than 30 per cent of rural-urban migrants and about 40 per cent of rural-rural migrants had only attended primary school compared with less than 20 per cent of migrants to urban areas and just over 22 per cent of migrants to rural areas by urban-born youth.

## Chapter 9. Youth on the move

Table 9.5
Percentage of urban- and rural-born youth lifetime inter-State/Region migrants by type of migration flow, and non-migrants, by selected characteristics, 2014 Census

Those youth who moved from an urban birthplace to another urban area are almost as likely to have not been married as urban-born non-migrants in an urban area. Those who were born in rural areas and who moved to an urban area have a similarly low proportion of ever-married ( 22.7 per cent) as urban-urban migrants. Youth who migrated to rural areas in another State/Region, whether they were urban- or rural-born, are much more likely to be married ( 34.4 per cent and 39.2 per cent) - even more likely than rural-born non-migrants ( 25.8 per cent). Though not shown in the Table, this is true for both males and females. It is likely, therefore, that many young people who move to rural areas are doing so for the purpose of marriage.

Chapter 9. Youth on the move

Youth who are lifetime inter-State/Region migrants are much more likely to be employed compared to non-migrant youth. This is particularly striking for those who were born in rural areas. Only 21.6 per cent of rural-born non-migrants reported that they worked for government or a private employer, while 58.9 per cent of the rural-born who had moved to an urban area, and 46.0 per cent of those who had moved to another rural area, were so employed. A similar pattern, but less marked, is shown for the urban-born youth. In contrast, rural non-migrant youth are more likely to be working for a family business (21.9 per cent) or as an own account worker (14.9 per cent). Less than half the proportion of rural-born migrants were reported as full-time students compared with urban-born migrants (for both types of move).

The industries in which lifetime inter-State/Region migrants were working are indicative of the big changes that have occurred in youth's lives, especially for those migrants born in rural areas. Rural-born migrants - even those who moved to another rural area - are much less likely to be working in agriculture than the non-migrants they leave behind (a third compared with two thirds). They are, instead, much more likely to be working in other industries including manufacturing and construction and, if they moved to an urban area, aside from these two industries, trade and accommodation and food services are also common industries for these types of migrants. Urban-born migrants who move to another urban area are somewhat more likely to be working in manufacturing ( 21.0 per cent). However, a similar proportion of urban-born migrants who move to rural areas were working in agriculture (18.6 per cent), but in many other respects work in industries similar to their non-migrant peers.

### 9.2.2 Recent migration

Figure 9.5 shows the age-specific rates of migration over the period 12 months and five years prior to the Census for males and females aged 10-29 (see also Appendix 2, Table A2.38). A similar pattern of earlier, and higher levels of, migration of females as seen in lifetime migration (in Figure 9.1) is also shown here. Some 1.7 per cent of children (10-14) and 3.6 per cent of all youth (aged 15-29) had moved to a new Township in the 12 months prior to the Census, and 5.2 per cent and 10.8 per cent respectively, had moved less than five years before the Census, suggesting that rates have been increasing annually. Table 9.6 shows the reasons given for the most recent moves in each of these periods.

The majority of recent migrant children (aged 10-14) were reported as moving with their family: 53.5 per cent of boys and 54.6 per cent of girls in the 12 months before the Census, and 67.2 per cent and 67.8 per cent, respectively, less than five years before the Census. But the prime reason that youth, particularly older recent migrants, move is to find employment; for males aged 20-24, 64.1 per cent of migrants who had moved less than one year prior to the Census and 58.4 per cent of migrants who had moved less than five years prior to the Census reported this as the reason for moving. For both males and females, a higher percentage of one-year moves were for employment compared to five-year moves (though the rates for females were lower than for males). This suggests that young people are making frequent moves until they find steady employment.

## Chapter 9. Youth on the move

## Chapter 9. Youth on the move

### 9.3 International migration of youth

In total, 556,643 former household members aged 15-24 were reported in the 2014 Census to be living abroad who left Myanmar between 2010-2014, comprising 338,289 males and 218,354 females. Figure 9.6 shows the age distribution of the 1.4 million international emigrants between 2010 and 2014, by the age when they left. It shows that more males than females were reported to have moved abroad at every age. For both males and females, the ages 15-19 and 20-24 were the most common ages at departure. Table 9.7 shows that twofifths (over 41 per cent) of recent international emigrants left Myanmar between the ages of 15-24.

The number of migrant youth currently living abroad (671,000) - is quite large, and is, in fact, likely to be even larger, as the number of people reported to be living abroad is generally considered to be an undercount for the reasons noted earlier. The 2014 Census enumerated 8.2 million youth living in conventional households in Myanmar, thus for every 100 youth resident in Myanmar, another eight were living in another country. In some States/Regions and Districts the ratio was much higher, suggesting that international youth migration has become a common occurrence in some areas.

| Total | $\mathbf{1 , 3 6 6 , 2 9 3}$ | $\mathbf{1 0 0 . 0}$ | $\mathbf{8 4 2 , 6 8 4}$ | $\mathbf{1 0 0 . 0}$ | $\mathbf{5 2 3 , 6 0 9}$ | $\mathbf{1 0 0 . 0}$ |

Table 9.8 shows the number of youth reported to be living abroad by each State/Region of origin, which have been ranked in order of the ratio of international migrants to those resident in those States/Regions at the time of the Census. The largest number of youth living abroad are from Mon - almost 135,000 representing one in five of all emigrant youth. For every 100 youth resident in this State, the Census reported another 44.3 living in another country, although the ratio is highest in Kayin (52.3). The border areas Tanintharyi and Chin also have ratios of migrant youth to usual residents in excess of 20 . Shan also reported a large youth population $(82,524)$ living abroad, but because of the size of the States' total population the ratio of migrants to usual residents ( 8.3 per 100) is about the same as the Union average.

The Districts with the most extensive international youth emigration are listed in Table 9.9. They are all in the five States/Regions mentioned as having a large number or ratio of international migrants, and are all either Districts bordering international borders or are neighbouring such Districts. (The data for all Districts is given in Appendix 2, Table A2.39.)

|  |  |  |  |

Chapter 9. Youth on the move

Out of $10,877,832$ households enumerated at the Union level, only 491,370 ( 4.5 per cent) of the total households reported having at least one emigrant youth, and of these a large majority ( 405,677 households, 82.6 per cent) were located in rural areas. This implies that the impact of youth emigration on the Union is greatly influenced by emigrant youth from rural areas.

The 2014 Census has shown that households with at least one youth living abroad tend to be more economically disadvantaged than those households with no such migrants. Figure 9.7 shows the distribution of households with and without an emigrant youth by wealth index (described in Appendix 3). In urban areas, households with an emigrant youth are somewhat disadvantaged in the wealth index distribution as indicated by the difference in the proportions of households with and without an emigrant youth in the highest quintile (46.2 per cent with an emigrant compared to 55.9 per cent without).

In rural areas, however, the proportion of households with an emigrant youth is distinctly lower in the lowest wealth quintile ( 21.1 per cent) than households without an emigrant youth (28.8 per cent). Indeed, well over half of households without an emigrant youth ( 55.5 per cent) are in the lower two quintiles compared to 45.7 per cent of households with an emigrant youth, suggesting that in rural areas it is households without an emigrant youth that are more disadvantaged. At the Union level, the profile of households without an emigrant (being the majority) shows a distribution close to the equal spread of 20 per cent of all households among each of the quintile groups. Those households with an emigrant youth, however, show a lower proportion in the highest quintile (just 11 per cent) with more households distributed among the middle three categories.

Figure 9.7
Percentage of households with and without an international emigrant youth by wealth index, urban and rural areas, 2014 Census

The preponderance of households with an emigrant youth in the middle three quintiles shown at the Union level at Figure 9.7 is broadly reflected in most States/Regions with the exception of Yangon and Rakhine. In Rakhine, the lowest quintile has the highest proportion ( 68.3 per cent) of households with a former youth household member living abroad. In Yangon, the

## Chapter 9. Youth on the move

reverse is the case; there the highest proportion of households with an emigrant youth (61.4 per cent) is in the highest wealth quintile. Numbers and proportions of households with and without youth emigrants by wealth index quintile are presented in Appendix 2, Table A2.40a and $b$.

Compared to households without an emigrant youth, those with an emigrant youth show three types of wealth distribution at the State/Region level: Yangon and Kachin show higher proportions of households in the highest quintile with lower proportions in the lower quintiles; Rakhine shows a higher proportion in the lower two quintiles with a lower proportion in the three highest quintiles; and the rest of the States/Regions show higher proportions in the three middle quintiles (Appendix 2, Table 2.40 b). Note that as mentioned earlier in this report, the data for Rakhine might have been affected by the non-enumeration of populations in certain parts of the State.

Figure 9.8
Percentage of households with and without an international emigrant youth by wealth index quintile, State/Region, 2014 Census

[^1]Chapter 9. Youth on the move

The same pattern is observed by comparing the highest quintile and the lowest quintile as presented at Appendix 2, Table A2.40c. In Yangon and Kachin, households with an emigrant youth show higher proportions in the highest quintile and lower proportions in the lowest quintile than households without an emigrant youth. In Rakhine, however, households with an emigrant youth show higher proportions in the lowest quintile and lower proportions in the highest quintile than households without an emigrant youth.

Analysis at the District level also shows three types of household wealth distribution as presented in the same Appendix tables. The first type is a disadvantage to households with an emigrant youth, where there are higher proportions in the lowest quintile and lower proportions in the highest quintile, compared to households without an emigrant youth. These Districts include Loikaw (in Kayah), Monywa and Hkamti (in Sagaing), Sittway, Maungtaw, and Kyaukpyu (in Rakhine), Pakokku and Gangaw (in Magway), and Makman (in Shan). The second type is an advantage to households with an emigrant youth, where there are higher proportions in the highest quintile and lower proportions in the lowest quintile. Fifteen Districts show this type of pattern: Mohnyin (in Kachin), Katha and Mawlaik (in Sagaing), Kawthoung (in Tanintharyi), Pyay (in Bago), Mandalay and Pyin Oo Lwin (in Mandalay), North, East, South, and West Yangon (in Yangon), Hopan and Minephyat (in Shan), and Phyapon and Labutta (in Ayeyawady). The majority of Districts, however, show that households with an emigrant youth have lower proportions in both the lowest and highest quintile, compared with households without an emigrant youth.

Throughout this section, the interpretation of results on the emigration of youth by wealth index at various levels of geographic units, should be treated with caution. Whether wealth distribution is the cause or effect of the international emigration of youth cannot be derived from the Census-based data.

### 9.4 Summary

The 2014 Census is a rich data source for exploring the dynamics and consequences of the migration of youth. This chapter could only touch on some of the issues but it has revealed how beneficial migration can be for youth.

Almost one in five (19 per cent) of youth aged 15-24 have moved from the Township where they were born. Moving away from one's birthplace increases during these important years. At age 15 only 13 per cent have moved away; by age 25,23 per cent have done so. The majority ( 57 per cent) of youth who are lifetime migrants have moved to another State/ Region but the breakdown between inter- and intra-State/Region moves varies between States/Regions. In more prosperous areas, such as Yangon Region and Kachin State, young people stay within the same State/Region. Indeed, young people whose birthplace was Yangon account for 19 per cent of all lifetime migrations by Myanmar youth. In the poorer States/Regions, more young migrants move away.

Yangon is the main destination for young inter-State/Region migrants. Almost half ( 48 per cent) of all inter-State/Region lifetime migrants aged 15-24 moved to Yangon. Most of the young people that do so come from the nearby States/Regions of Ayeyawady, Rakhine,

## Chapter 9. Youth on the move

## Tanintharyi, Bago, Mon and Magway.

Both rural- and urban-born youth migrate to urban areas. The majority of inter-State/Region migrants into Yangon and Nay Pyi Taw are from urban areas. Young migrants in other States/ Regions are more likely to be from rural areas. Overall, young people benefit from migration. They are more likely to be employed as a result of moving.

As Myanmar has opened up its borders, youth have moved to live abroad. A total of 671,000 people were reported to have left Myanmar aged 15-24 prior to the Census. This amounts to eight youth living abroad for every 100 youth resident in Myanmar. Males comprise 60 per cent of young international migrants. The border States/Regions of Kayin, Mon, Tanintharyi, and Chin have the highest ratio of international migrants to resident youth. Overall, households with a youth living abroad have a slightly higher wealth index score than households without a youth living abroad.

## Chapter 10. Conclusions and recommendations

### 10.1 Transitions to adulthood

This report has described children's and youth's pathways to adulthood. School attendance is nearly universal for children aged under 12 but declines steadily thereafter. By age 13 or 14 the proportion of children in the labour force starts to increase. By age 23 , about 90 per cent of males are in the labour force. In contrast, the female labour force participation rates level off at 60 per cent at age 21 and start to decline from age 25 . Girls start to marry from the age of 17 , and by age 23 half are married. Boys marry later; it is only by age 25 that half of males are married. However, the proportions of youth living outside the parental home lag behind levels of employment and marriage; it is only by age 25-29 that one half of youth are living independently of their parents, either as a head of household or spouse of a head, with other relatives or non-relatives, or in institutions.

### 10.2 The state of children and youth

This report has addressed two broad questions:

- How well are the children of Myanmar being given a good start in life through better health, a nurturing home environment and educational opportunities?
- Are youth transitioning to adulthood in ways which will contribute to the economic and social development of the country?

The vast majority of children live with at least one parent, attend school, and gain basic literacy skills. However, extensive poverty and a poor rural infrastructure means that many children are living in unhealthy domestic environments, putting them at risk of infectious diseases and injuries. A sizable proportion of children and youth live in households without access to basic transport and are not connected to the wider world through a radio or television. In 2014, mobile phones and the internet had not penetrated most rural, and many urban households. Poverty and the lack of public services are contributing to infant and child mortality rates, which are the second highest among ASEAN countries.

Many children are extremely vulnerable. About 12 per cent of children aged 10-14 are in the labour force, a rate that has not changed significantly in thirty years. In some parts of the country the proportions of children living in institutions are unusually high. At the Union level, 6 per cent of girls aged 15-17 are married.

Many youth are getting more opportunities to enter the labour force. Over one in five urban youth have studied beyond high school, and unemployment rates are very low, except for 20-24 year olds with higher education. However, many jobs are low skilled, insecure and, in some cases, dangerous. Females quickly withdraw from the labour force when they marry, resulting in fewer economically productive adults. High proportions never marrying means that females who remain in the labour force may never marry.

There are also some youth that are particularly disadvantaged, notably the illiterate and those with a disability. Children who have no education go to work at an early age but, as they grow older, they are more likely to become unemployed.

### 10.3 Recommendations

### 10.3.1 Recommendations for the next census

The 2014 Census is a rich source of information on children and youth. In time, researchers and policy advisors will gain more insights than could be included in this report. Especially valuable will be analysis at the household level, and further understanding of the linkages between education, migration and employment.

To enhance the value of the next census, the following changes should be considered.

- Poverty is still prevalent in Myanmar and a major determinant of the life chances of children and youth. Prior to the next census a robust, but simple, poverty indicator should be developed and verified, and its component variables collected.
- Parents are fundamental to the healthy development of their children. By only recording the relationship between individuals and the head of household, it is not possible to identify definite mother-child pairings unless the mother is the head of household. The census would be more informative if it could add a record linking children to their parents, regardless of the head of household. This is particularly important in Myanmar where so many three-generation households are headed by a member of the oldest generation.
- Every attempt should be made during pre-census tests to identify the use of the 'other' and 'not stated' categories and to create new codes to minimize their use.
- Incorporating the migration questions into the institutional questionnaire would provide a much fuller picture of youth mobility particularly among students. About 9 per cent of youth were enumerated using the institution questionnaire. Many of these youth would have moved from another Township for employment or education.

### 10.3.2 Recommendations for policy

There are three types of policies needed to support children and youth to allow them to become healthy and prosperous adults (World Bank, 2006). Firstly, policies should direct resources towards essential infrastructure and services to give all children the best possible start in life and prepare them for productive work. Secondly, policies should support young people to find employment, including vocational training, and ensure appropriate workplace standards. Thirdly, policies should give disadvantaged young people more chances to gain basic skills and opportunities for safe housing and meaningful work.

The Government of Myanmar is developing and implementing all three types of policies. The information from the Census indicates where efforts are most needed and provides a baseline to monitor progress. Five broad priorities emerged from the results in this report:

## 1. Invest in a healthy foundation

Improving the health infrastructure in rural areas will go a long way to reducing the risk of disease. This includes not only increasing access to improved drinking water and sanitation, but also the wider provision of electricity, roads and affordable primary health care services in the most disadvantaged communities.

## Chapter 10. Conclusions and recommendations

## 2. Invest in meaningful and accessible education

Too many children are not completing primary school, and fewer still secondary school. Barriers to attendance need to be addressed. These include the cost of school fees, textbooks, uniforms, transport, food and lodging and the insufficient numbers (and quality) of lower and upper secondary schools in some areas. Changing the perceived and actual value of remaining in school is also important.

## 3. Make it easier for youth to gain decent employment

As the economy expands, young people should have a greater opportunity to find employment. This means encouraging industries to offer safe working conditions for workers with a range of skills. Vocational training and more workplace-relevant basic schooling will help youth find work in the new economy.

## 4. Encourage female labour force participation

Workplaces and the broader community need to reduce the cultural and practical barriers to women staying in the labour force after marriage and childbirth. Increasing the labour force participation of women will lead to greater economic growth.

## 5. Offer second chances

A growing economy should not neglect its most disadvantaged members. Opportunities for adult education and disability-inclusive economic and social participation are needed.

## Glossary of terms and definitions

Adjusted labour force participation: is similar to labour force participation but where 'household work' is included.

Adolescent fertility rate: is the age-specific fertility rate for women aged 15-19, typically expressed in terms of per 1,000 women for more convenient presentation.

Age-specific fertility rate: is the number of births to women in a specific age-group during a specified time period divided by the person-years lived by women in the same age-group during the period.

Child dependency ratio (CDR): is the number of children aged 0-14 per 100 persons in the working-age population (those aged 15-64).

Child mortality rate: is the probability of a child born in a specific year or period dying between the age of 1 year and before reaching the age of 5 years, if subject to age-specific mortality rates of that period. It is expressed as the number of children that die between age 1 and 4 divided by the number of children alive at age 1 multiplied by 1,000.

Children: is generally taken to mean those persons aged 0-14. Different definitions are applied to some analyses in this report (see Section 1.1.2).

Conventional household: includes one or more persons who are either related or unrelated and share living quarters (single quarter or compound) and meals. The household members would usually eat food prepared from the same cooking pot. In most cases, there would be one person acknowledged by the household members as the head of the household.

Decent employment/work: according to the International Labour Organization (ILO), decent work involves opportunities for work that are productive and deliver a fair income; security in the workplace and social protection for families; better prospects for personal development and social integration; freedom for people to express their concerns, organize and participate in the decisions that affect their lives; and equality of opportunity and treatment for all women and men.

Demographic dividend: is the economic growth potential that can result from shifts in a population's age structure, mainly when the share of the working-age population (15-64) is larger than the non-working age share of the population.

Elementary occupations: are those occupations consisting of simple and routine tasks which mainly require the use of hand-held tools and often require some physical effort.

Employed: are persons reported in the 2014 Census as either an employee, employer, own account worker, or contributing family worker.

Employment rate: is the proportion of the working-age population that is employed. This is also known as the employment-to-population ratio.

Head of (conventional) household: is the household member (of either sex) who makes key decisions and is generally recognized as the head by the other members. That person is not necessarily responsible for earning the main livelihood for the household. In the 2014 Census if the head of household was not present in the household on Census Night (and thus not enumerated in the household) the next most responsible member was reported as the de facto head.

Improved drinking water: is drinking water from a source that is defined as one that, by nature of its construction or through active intervention, is likely to be protected from outside contamination, in particular from contamination with faecal matter. The 2014 Census identified the following sources as 'Improved': Tap/piped water; Tube well/borehole; Protected well/spring; and Bottled/purified water. All other sources of drinking water identified in the Census were classified as 'Unimproved'.

Improved sanitation: is a toilet facility that hygienically separates human excreta from human contact. The 2014 Census identified the following toilet facilities as 'improved': Flush; Water seal (improved latrine); and Pit latrine. All other types of toilet identified in the Census were classified as 'Unimproved'.

Infant mortality rate: is the probability of a child born in a specific year or period dying before reaching the age of 1 year, if subject to age-specific mortality rates of that period, expressed as the ratio of deaths of children under one year of age to the number of live births in the same year. The rate is generally expressed per 1,000 live births.

Institution population: are a group of people who live together but cannot be said to belong to a conventional household. Examples of institutions include: old-people's homes; orphanages; hospitals; boarding schools; hotels, hostels and inns; institutions for persons with disabilities; prisons; monasteries; convents; military and police barracks; and camps for workers.

Labour force: is the sum of the number of persons employed and the number unemployed and seeking work. Thus, participation in the labour force includes employees, employers, own account workers, contributing family workers, and those that sought work.

Labour force participation rate: is the ratio of the labour force to the working-age population.

Life expectancy at birth: is the average number of years that a newborn baby is expected to live if the mortality conditions of the year corresponding to the life table remain constant.

Lifetime migrant: see Migrant.

Literacy: is the ability to both read and write in any one language with reasonable understanding. A literate person is one who can read and write a short simple statement on everyday life in any one language. An illiterate person is one who cannot.

Literacy rate: is the total number of literate persons in a given age-group, expressed as a percentage of the total population in that age-group.

Migrant: is a person who, at some time in their lives, lived in a Township different to the one they were born in.

NEET rate: is the percentage of a population group not in employment, education or training.

Primary school age: children aged 5-9 years.

Recent migrant: is a migrant who changed the Township of their place of usual residence either in the one-year or five-year period before the Census.

Rural area: is an area defined by the Department of General Administration as a village tract. Generally these areas have relatively low levels of population density, and a land use that is predominantly agricultural.

Secondary school age: children aged 10-15. Those aged 10-13 are referred to as lower secondary; those aged 14-15 as upper secondary. Lower secondary is sometimes referred to as Middle school. Upper secondary is sometimes referred to as High school.

Sex ratio: is the number of males per 100 females in a population.

Singulate mean age at employment: is the average age of starting employment for those children and youth who will join the labour force by the age of 30 .

Singulate mean at marriage: is the average length of never married life for those who subsequently marry before the age of 50 . It is calculated by adding the years spent single up to the age of 50 minus those years single by people who have not married by the age of 50 and divided by the proportions of never married by age 50 .

Skilled agricultural work: skilled agricultural and fishery workers grow and harvest field or tree and shrub crops; gather wild fruits and plants; breed, tend or hunt animals; produce a variety of animal husbandry products; cultivate, conserve and exploit forests; breed or catch fish; and cultivate or gather other forms of aquatic life in order to provide food, shelter and income for themselves and their households.

Total fertility rate: is a summary measure of the level of fertility in a population. It is the average number of children per woman that would be observed for the reproductive age span for a birth cohort of women who experience given age-specific fertility rates. When the reproductive age span is taken to be 15-49 years, and birth rates are given for five-year age groups, total fertility is calculated as five times the sum of the age-specific fertility rates for ages 15-19 through to 45-49.

Under-five mortality rate: is the probability of a child born in a specific year or period dying before reaching the age of five years, if subject to age-specific mortality rates of that period. It is expressed as the number of children who die before reaching the age of five per 1,000 live births in a given period.

Unemployment rate: is the ratio resulting from dividing the total number of unemployed by the corresponding labour force. Unemployed persons do not have work but are seeking work.

Unimproved sanitation: see Improved sanitation.

Unimproved sources of drinking water: see Improved drinking water.

Urban area: is an area defined by the Department of General Administration as a ward. Generally these areas have relatively higher levels of population density, building structures and infrastructural development.

Wealth index: the 2014 Census did not contain a question on personal or household income. However, a number of questions were included in the main census questionnaire that made it possible to construct a wealth index and divide the population in to wealth quintiles, that is equal sized groups of people each representing 20 per cent of the population. (For more details see Appendix 3).

Working-age population: those persons aged 15-64 years.

Youth: are generally taken to mean those persons aged 15-24. Some analyses in this report extends this age group to include those aged 15-29.

Youth bulge: is the percentage of the working-age population (15-64) that are aged 15-24.

Youth unemployment rate: is the unemployment rate of persons aged 15 to 24 .

Note: Children with parents include children who are the son/daughter or adopted child of the head of household; the grandchildren of the head with a son or daughter or a son/daughter-in-law also living in the house; or a sibling of the head of household with a parent also living in the household. Children not living with a parent are a head or spouse of head, or live with a grandparent or sibling as head without someone who could be a parent.

## Appendix 3. Wealth Index

A wealth index is a composite measure of a household's cumulative living standard. It is generally calculated using easy-to-collect data on a household's ownership of selected assets, such as televisions and bicycles; materials used for housing construction; and types of water access and sanitation facilities.

The 2014 Census did not contain a question on personal or household income. However, information was collected from the responses to a number of questions relating to housing characteristics and the household's assets included in the main Census questionnaire (Questions 32-39) that made it possible to construct a wealth index - as a composite measure of a household's cumulative living standard - from the 2014 Census data, and to divide the population into wealth quintiles, that is, five equally-sized groups of people each representing 20 per cent of the population.

The first quintile represents the lowest fifth of the population in terms of their wealth status, the second quintile represents the second fifth, and so on. It should be clear that the wealth index is fundamentally different from information on income or consumption, which are direct indicators of absolute poverty. Instead, it is a measure of relative poverty/wealth as it gives the position of a household compared to other households in the country.

The relevant indicator variables derived from the Census were:

- The number of de facto household members
- The presence of a live-in domestic worker
- Ownership of household assets (such as a radio, television, mobile phone, access to internet, car, etc.)
- Access to basic household amenity services (such as improved sources of drinking water, improved sanitation, electricity supply, and main building construction materials).

The wealth index and quintiles were calculated at the household level. However, for the purposes of the analysis in this report, the wealth index/quintiles of individuals were assigned on the basis of the wealth index score of the household in which they were enumerated.

## List of Contributors

Contributors to the Children and Youth thematic report

| Name | Institution | Role |
| :---: | :---: | :---: |
| Government Coordination |  |  |
| U Myint Kyaing | Permanent Secretary, Ministry of Labour, Immigration and Population | Overall administration and coordination |
| U Nyi Nyi | Deputy Director General, Department of Population (DoP) | Administration, coordination and quality control |
| Daw Khaing Khaing Soe | Director, DoP | Administration, coordination and quality control |
| UNFPA Coordination |  |  |
| Janet E. Jackson | Country Representative | Overall administration and coordination |
| Mercedita Tia | Chief Technical Advisor | Overall design, administration, coordination and quality assurance |
| Daniel Msonda | Programme Specialist, Census | Administration and coordination |
| Thet Thet U | Programme Assistant | Administration and logistics |
| Thida Aye Maung | Programme Assistant | Administration and logistics |
| Tun Tun Win | Project Assistant | Administration and logistics |
| Authors |  |  |
| Ann Larson | UNFPA Consultant | Lead Author |
| Daw Yin Yin Kyaing | Deputy Director, DoP | Assisting Author |
| Daw Aye Theingi Win | Staff Officer, DoP | Trainee and Assisting Author |
| Daw Thet Htar Nwe | Immigration Assistant, DoP | Trainee and Assisting Author |
| Daw Mon Mon Kyaw | Junior Clerk, DoP | Trainee and Assisting Author |
| Reviewers and Editors |  |  |
| UNICEF | Peer review |  |
| Nancy Steigler | Peer review |  |
| Esther Bayliss | UNFPA Consultant | Review, editing and proofreading |
| Ian Stuart White | UNFPA Consultant | Review and editing |
| Daniel Msonda | Programme Specialist, Census | Review, editing and proofreading |
| Kyung Ae Park | UNFPA Census Consultant | Review and quality assurance |
| U Nyi Nyi | Deputy Director General, DoP | Review, editing and proofreading |
| Daw Khaing Khaing Soe | Director, DoP | Review, editing and proofreading |
| Data Processing and IT Team |  |  |
| Arij Dekker | UNFPA Data Processing Consultant | Data editing and programming |
| Daw Khaing Khaing Soe | Director, DoP | Programming and generation of tables |
| Daw Sandar Myint | Deputy Director, DoP | Programming and generation of tables |
| Daw May Myint Bo | Staff Officer, DoP | Generation of tables |
| Daw Lin Lin Mar | Staff Officer, DoP | Generation of maps |
| Daw Su Myat Oo | Immigration Assistant, DoP | Generation of tables |
| U Thant Zin Oo | Assistant Computer Operator, DoP | Generation of maps |
| U Wai Phyo Win | UNFPA Census IT Manager | Information technology services |
| Designer |  |  |
| Karlien Truyens | UNFPA Consultant | Graphic designer |
